Mr. Bonsor said that the case was being defended by the Grocers' and Provision Dealers' Association, not in any captious spirit or to avoid payment of a paltry penalty, but because they considered it a matter of considerable importance. It was a matter of some surprise that it was only after the expiration of twenty-four years that the Pharmaceutical Society had thought proper to do what was now represented to be a public duty. It was not a question of the safety of the public, but it really meant that if the Society were right in their contention that no one but a chemist or druggist in this country could sell a preparation containing as an ingredient one of the poisons mentioned in the Act, they would secure to themselves a monopoly of the sale of a very large number of valuable medicines and deprive the public and a very large portion of the poorer classes living in outlying districts, of the means of obtaining simple remedies in cases of illness. There was hardly a cough drop, or antibilious pill, or a tonic, or a medicine of common-day use that had not some preparation in it containing poison. If their contention was good, these things, even cough drops, would have to be labelled with the word poison and sold only by chemists and druggists. What the plaintiffs had to show was that this preparation was in itself a poison. Proprietary medicines had always been regarded as patent medicines in the trade, and the exemption in the Act referring to medicines under letters patent included the proprietary or so-called patent medicines.

In summing up his Honour said that the question was whether chlorodyne was a poison or not. The defence was that although it contained some of three different poisons, it was mixed with other preparations. The label itself settled the question. The question was: Did the poison cease to be a poison because it was mixed with something else? The mischief intended to be prevented by the Act would

be allowed if it were once admitted that they had only to mix a poison with water or something else, and it ceased to be a poison. It seemed to him almost too clear for argument that a poison, however mixed up with other things, did not cease to be a poison. He was told that this was a patent medicine, and came within the exemption clause. He could quite understand that the title had been kept up as a handy and convenient one for the vendors in this business; but he found that there was something recognised by the law as a patent medicine and other preparations that required a stamp, while to include anything else of a similar character there were the general words in the schedule. Patent medicines were protected and exempted because everybody could know what they contained; but nostrums and proprietary medicines might contain the most deadly poisons and be of the utmost injury to the public without anyone but the owner being aware of it. He could not hold that these were exempted, and thought the defendants were liable to the penalty.

Application for leave to appeal was made and granted, the other cases standing over until after the appeal has been heard.

## VITAL STATISTICS.

### HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns 5923 births and 3838 deaths were registered during the week ending Dec. 10th. The annual rate of mortality in these towns, which had been 18·9 and 18·8 per 1000 in the preceding two weeks, rose again last week to 19·6. In London the rate was 17·7 per 1000, while it averaged 21·0 in the thirty-two provincial towns. The lowest rates in these towns were 11·2 in Halifax, 13·0 in Leicester, 14·7 in Gateshead and 15·1 in Huddersfield; the highest rates were 26·1 in Manchester, 28·3 in Bolton, 29·5 in Oldham and 31·6 in Salford. The 3838 deaths included 444 which were referred to the principal zymotic diseases, against 424 and 429 in the preceding two weeks; of these, 164 resulted from measles, 77 from diphtheria, 60 from whooping-cough, 56 from scarlet fever, 41 from diarrhoea, 41 from "fever" (principally enteric), and 5 from small-pox. No fatal case of any of these diseases occurred last week either in Halifax or in Wolverhampton; in the other towns they caused the lowest death-rates in Huddersfield, Bristol and Newcastle-upon-Tyne, and the highest rates in Hull, Oldham, Brighton and Salford. The greatest mortality from measles occurred in Bolton, Croydon, Oldham, Hull, Brighton and Salford; from scarlet fever in Salford, Swansea, Plymouth and Preston; from whooping-cough in Norwich, Nottingham, Birkenhead, Gateshead and Birmingham; from "fever" in Preston, Derby and Swansea; and from diarrhoea in Burnley. The 77 deaths from diphtheria included 58 in London, 3 in Sheffield, 2 in West Ham and 2 in Bradford. Three fatal cases of small-pox were registered in Oldham, one in Sheffield and one in Birkenhead, but not one in London or in any other of the thirty-three large towns; 31 cases of this disease were under treatment in the Metropolitan Asylum Hospitals and one in the Highgate Small-pox Hospital on Saturday last. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 3772, against 4045, 3945 and 3882 on the preceding three Saturdays; 273 new cases were admitted during the week, against 303 and 302 in the preceding two weeks. The deaths referred to diseases of the respiratory organs in London, which had been 353 and 343 in the preceding two weeks, further fell to 339 last week, and were 105 below the corrected average. The causes of 78, or 2·3 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Brighton, Bristol, Oldham, Newcastle-upon-Tyne, and in six other smaller towns; the largest proportions of uncertified deaths were registered in Birmingham, Liverpool, Huddersfield and Sheffield.

### HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had increased from 20·6 to 24·2 per 1000 in the preceding four weeks, further rose to 24·5 during the week ending Dec. 10th, and exceeded by 5·6 per 1000 the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 13·2 in Greenock and 17·2 in Perth to 25·4 in Glasgow and 41·6 in Leith. The 683 deaths in these towns included 102 which were referred to measles, 13 to scarlet fever, 13 to diphtheria, 12 to whooping-cough, 10 to diarrhoea, 6 to "fever," and not one to small-pox. In all, 156

deaths resulted from these principal zymotic diseases, against 162 and 158 in the preceding two weeks. These 156 deaths were equal to an annual rate of 5·6 per 1000, which exceeded by 3·3 the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of measles, which had increased from 61 to 112 in the preceding four weeks, declined to 102 last week, of which 31 occurred in Edinburgh, 28 in Leith and 26 in Glasgow. The deaths referred to scarlet fever, which had been 28 and 16 in the preceding two weeks, further declined to 13 last week, and included 11 in Glasgow. The 13 fatal cases of diphtheria considerably exceeded the number recorded in any recent week; 8 occurred in Glasgow and 3 in Edinburgh. The 12 deaths from whooping-cough corresponded with the number in the preceding week, and included 8 in Glasgow, where 3 of the 6 fatal cases of "fever" were also recorded. The deaths referred to diseases of the respiratory organs in these towns, which had been 141 and 134 in the preceding two weeks, rose again to 151 last week, but were little more than half the number in the corresponding week of last year, when influenza was very fatally prevalent. The causes of 68, or 10 per cent., of the deaths in these eight towns last week were not certified.

### HEALTH OF DUBLIN.

The death-rate in Dublin, which had been 22·8 and 23·3 per 1000 in the preceding two weeks, further rose to 24·0 during the week ending Dec. 10th. During the past ten weeks of the current quarter the death-rate in the city averaged 23·2 per 1000, against 17·8 in London and 22·9 in Edinburgh. The 161 deaths in Dublin during the week under notice exceeded by 5 the number in the preceding week, and included 3 which were referred to diarrhoea, 2 to "fever," one to whooping-cough, one to scarlet fever and not one either to small-pox, measles or diphtheria. In all, 7 deaths resulted from these principal zymotic diseases, equal to an annual rate of 1·0 per 1000, the zymotic death-rate during the same period being 1·9 in London and 7·5 in Edinburgh. The fatal cases of diarrhoea, which had been 2 in each of the preceding two weeks, were 3 last week. The deaths referred to different forms of "fever," which had increased from 2 to 6 in the preceding three weeks, declined again to 2 last week. The 161 deaths registered in Dublin last week included 26 of infants under one year of age and 44 of persons aged upwards of sixty years; the deaths of infants showed a marked decline, while those of elderly persons showed an increase upon recent weekly numbers. Six inquest cases and 6 deaths from violence were registered; and 60, or more than a third, of the deaths occurred in public institutions. The causes of 17, or nearly 11 per cent., of the deaths in the city last week were not certified.

### VITAL STATISTICS OF LONDON DURING NOVEMBER, 1892.

In the accompanying table will be found summarised complete statistics relating to sickness and mortality during the month of November in each of the forty-one sanitary districts of London. With regard to the notified cases of infectious disease in the metropolis during last month, it appears that the number of persons reported to be suffering from one or other of the nine diseases in the accompanying table was equal to 14·6 per 1000 of the population, estimated at 4,263,294 persons in the middle of this year. Owing to the epidemic prevalence of scarlet fever and of diphtheria in London this rate had steadily increased during the preceding nine months from 5·1 to 17·9 per 1000. Among the various sanitary districts the rates last month were considerably below the average in St. George Hanover-square, Westminster, St. James Westminster, Hampstead, Strand, City of London, and Woolwich; while they showed the largest excess in Hackney, Holborn, Bethnal Green, Whitechapel, Limehouse, Mile-end Old Town, and St. Olave Southwark. The prevalence of small-pox in London showed a further increase during November, 32 cases being notified during the month, against 3 and 10 in the preceding two months; of these 32 cases, 19 belonged to Islington, 5 to Hackney, 3 to Lambeth, and 2 to St. Pancras sanitary districts. The Metropolitan Asylum Hospitals and the Highgate Small-pox Hospital contained 20 small-pox patients at the end of November, against 8 and 6 at the end of the preceding two months; the weekly admissions averaged 5, against 2 and 1 in the previous two months. The prevalence of scarlet fever in London during November showed a slight decline from that recorded in recent months;

MONTHLY ANALYSIS OF SICKNESS AND MORTALITY STATISTICS IN LONDON.—NOVEMBER, 1892.  
(Specially compiled for THE LANCET.)

Sanitary areas.	Estimated population in the middle of 1892.	NOTIFIED CASES OF INFECTIOUS DISEASE.										DEATHS FROM PRINCIPAL INFECTIOUS DISEASES.														
		Small-pox.	Scarlet fever.	Diphtheria.*	Typhus fever.	Enteric fever.	Other continued fevers.	Puerperal fever.	Erysipelas.	Cholera.	Total.	Annual rate per 1000 persons living.	Small-pox.	Mesles. \* Including 69 cases of membranous typhoid.

this disease was proportionally most prevalent in Fulham, Hackney, Holborn, Bethnal Green, Limehouse, Mile-end Old Town, St. Olave Southwark, Battersea, and Wandsworth sanitary areas. The Metropolitan Asylum Hospitals contained 3754 scarlet fever patients at the end of November, against numbers increasing from 1142 to 3843 at the end of the preceding nine months; the weekly admissions averaged 363, against 355 and 429 in the preceding two months. Diphtheria also showed decreased prevalence during the month under notice; this disease was proportionally most prevalent in St. Pancras, Clerkenwell, Bethnal Green, Whitechapel, St. George-in-the-East, Mile-end Old Town, Rotherhithe, and Plumstead sanitary areas. There were 255 cases of diphtheria under treatment in the Metropolitan Asylum Hospitals at the end of November, against 318 and 312 at the end of the preceding two months; the weekly admissions averaged 48, against 55, 54, and 57 in the preceding three months. Enteric fever was proportionally most prevalent during November in Hackney, Holborn, Limehouse, Mile-end Old Town, and Lewisham sanitary areas. The Metropolitan Asylum Hospitals contained 113 enteric fever patients at the end of November, against numbers increasing from 47 to 124 at the end of the preceding six months; the weekly admissions averaged 15, against 14, 20, and 15 in the preceding three months. Erysipelas showed the highest proportional prevalence during the month under notice in Marylebone, Islington, St. Giles, Holborn, Clerkenwell, Bethnal Green, Mile-end Old Town, and Poplar sanitary areas. Eleven cases of puerperal fever were notified during November in Islington, 5 in Camberwell, and 4 in Lambeth sanitary districts.

The mortality statistics in the accompanying table relate to the deaths of persons actually belonging to the various metropolitan sanitary districts, the deaths occurring in the institutions of London having been distributed among the various sanitary districts in which the patients had previously resided. The distribution of these deaths, and especially of those resulting from zymotic diseases, affords the most trustworthy data that can be secured upon which to calculate reliable rates of mortality. During the five weeks ending on Saturday, Dec. 3rd, the deaths of 7309 persons belonging to London were registered, equal to an annual rate of 17.9 per 1000, against 16.9, 15.7, and 17.1 in the preceding three months. The lowest death-rates during November in the various sanitary districts were 9.6 in Hampstead, 12.7 in Lewisham (excluding Penge), 13.3 in St. James Westminster and in Wandsworth, 14.1 in Paddington, and 14.8 in Kensington; in the other sanitary districts the rates ranged upwards to 21.5 in the Strand, 22.8 in St. Olave Southwark, 23.8 in Limehouse, 24.1 in Whitechapel and in St. George-in-the-East, 24.9 in Bethnal-green, 25.9 in St. Saviour Southwark, and 27.6 in Holborn. During the five weeks of November 716 deaths were referred to the principal zymotic diseases in London; of these, 210 resulted from diphtheria, 159 from scarlet fever, 154 from measles, 78 from diarrhoea, 58 from different forms of "fever" (including 55 from enteric fever, 1 from typhus, and 2 from ill-defined forms of continued fever), 55 from whooping-cough, and 2 from small-pox. These 716 deaths were equal to an annual rate of 1.8 per 1000, against rates declining from 3.9 to 1.9 in the preceding four months. Among the various sanitary districts the lowest zymotic death-rates were recorded in St. George Hanover-square, Westminster, St. James Westminster, Hampstead, St. Giles, and St. Olave Southwark; and the highest rates in St. Martin-in-the-Fields, Clerkenwell, Bethnal Green, Whitechapel, St. George-in-the-East, Rotherhithe, and Greenwich. The 2 fatal cases of small-pox were 16 below the corrected average number in the corresponding month of the preceding ten years; both these cases belonged to Islington. The 154 deaths referred to measles were as many as 121 below the average; among the various sanitary districts this disease showed the highest proportional fatality in Bethnal Green, St. George-in-the-East, St. George Southwark, Greenwich, and Lewisham. The 159 fatal cases of scarlet fever were 11 below the corrected average, notwithstanding its general prevalence; this disease was proportionally most fatal in Fulham, Bethnal Green, Whitechapel, Mile-end Old Town, and Woolwich. The 210 deaths referred to diphtheria exceeded the corrected average by 75; this disease showed the highest proportional fatality in St. Pancras, St. Martin-in-the-Fields, Bethnal Green, St. George-in-the-East, Lambeth, Camberwell, and Plumstead. The 55 fatal cases of whooping-cough were little more than a third of the corrected average; this disease was somewhat fatally prevalent in Clerkenwell. The 58 deaths referred to different forms of "fever" were

just half the corrected average; there was no marked excess of fever mortality in any of the sanitary districts during the month under notice. The 79 fatal cases of diarrhoea were 19 below the corrected average. In conclusion, it may be stated that the mortality in London during November from these principal zymotic diseases in the aggregate was as much as 26 per cent. below the average.

Infant mortality in London, measured by the proportion of deaths under one year of age to registered births, was equal to 138 per 1000, and was slightly below the average; the lowest rates of infant mortality were recorded in Paddington, St. James Westminster, Marylebone, Hampstead, St. Giles, and Lewisham; the highest rates in the Strand, Holborn, Limehouse, St. Saviour Southwark, St. Olave Southwark, Rotherhithe, and Greenwich.

## THE SERVICES.

**SURGEON-COLONEL WADE** has been appointed to the Administrative Charge of the Aldershot Division. The death of Brigade-Surgeon J. Ferguson, retired pay, lately employed at Fleetwood, has been confirmed.

### ARMY MEDICAL STAFF.

Brigade-Surgeon-Lieutenant-Colonel Francis Johnson, M.B., F.R.C.S.I., retires on retired pay.

### INDIA AND THE INDIAN MEDICAL SERVICE.

The following appointments have been made:—5th Bombay Cavalry (Sind Horse): Surgeon-Captain J. B. Jameson to Officiate in Medical Charge, vice Surgeon-Captain J. G. Hojel, transferred temporarily to the Civil Department; 7th Bombay Lancers (Beluch Horse): Surgeon-Captain F. E. Murray to Officiate in Medical Charge, vice Surgeon-Captain J. L. T. Jones. Surgeon-Major A. Duncan, M.D., Corps of Guides (M.C.), has been granted leave for six months, and Surgeon-Captain C. T. Hudson, I.M.S., leave to proceed out of India for one year. Pension service, fourth year, commenced June 25th, 1892. Assistant-Surgeon P. P. Moolan and Surgeon-Captain W. E. Jennings have respectively delivered over and received charge of the Ratnagiri Gaol. Surgeon-Captain U. N. Mukerji, I.M.S., has passed the higher standard examination in Persian. Dr. D. McDonald and Mr. Nanabhai Ardesar Moos have respectively delivered over and received charge of the office of Lecturer in Experimental Physics at the Elphinstone College.

### NAVAL MEDICAL SERVICE.

The following appointments have been made:—Fleet Surgeon Alfred T. Corrie to the *Malabar*; Staff Surgeon Richard E. Biddulph to the *Canada*. Surgeons: Herbert W. G. Done to the *President*, additional, and Charles W. Sharples to the *Vivid*; George M'Gregor to the *Canada* and Charles G. Matthews to the *Vernon*.

### VOLUNTEER CORPS.

*Rifle*: 4th Volunteer Battalion, the Royal Scots (Lothian Regiment): Surgeon-Major J. McGibbon, M.D., to be Surgeon-Lieutenant-Colonel, to resign his commission, also to be permitted to retain his rank and to continue to wear the uniform of the Battalion on his retirement (dated Dec. 10th, 1892).

### THE VOLUNTEER OFFICERS' DECORATION.

In addition to the lists already published, this decoration has been conferred upon the following officers.—*North-Western District*: 1st Lancashire, Surgeon-Major Nicholas K. Marsh, retired; 3rd Lancashire, Surgeon-Lieutenant-Colonel Arthur A. Corte; 6th Lancashire, Surgeon-Lieutenant-Colonel Thomas Cayzer; 2nd Volunteer Battalion (the Royal Warwickshire Regiment), Brigade-Surgeon-Lieutenant-Colonel Clement Dukes, M.D.; 4th Volunteer Battalion, the Cheshire Regiment, Surgeon and Honorary Surgeon-Major Robert Hopwood, retired; 2nd Volunteer Battalion, the East Lancashire Regiment, Surgeon-Lieutenant-Colonel Luke Fisher, retired; 1st (Cumberland) Volunteer Battalion, the Border Regiment, Brigade-Surgeon-Lieutenant-Colonel Cornelius Scamp Hall; 1st Volunteer Battalion, the South Staffordshire Regiment, Surgeon-Lieutenant William F. M. Jackson; 3rd Volunteer Battalion, the South Staffordshire Regiment, Surgeon and Honorary Surgeon-Major J. Fraser, M.D., retired; 1st Volunteer Battalion, the Prince of Wales's Volunteers (South Lancashire Regiment), Surgeon-Captain (Honorary Surgeon-Major) Edward Lister; 2nd Volunteer

Battalion, the Loyal North Lancashire Regiment, Surgeon-Lieutenant-Colonel F. B. Mallett, M.D.; Surgeon and Honorary Surgeon-Major Robert Settle, M.D., retired; 1st Herefordshire, Brigade-Surgeon-Lieutenant-Colonel Peter B. Giles; 1st Volunteer Battalion, the Manchester Regiment, Surgeon and Honorary Surgeon-Major Edwin H. Roe, retired; 5th (Ardwick) Volunteer Battalion, the Manchester Regiment, Brigade-Surgeon-Lieutenant-Colonel John Armstrong, retired; 1st Volunteer Battalion, the Prince of Wales's (North Staffordshire Regiment), Surgeon-Major Wm. H. Folker, retired; Surgeon-Major William Dawes, retired; 2nd Volunteer Battalion, the Prince of Wales's (North Staffordshire Regiment), Brigade-Surgeon-Lieutenant-Colonel Herbert M. Morgan; Surgeon-Major Walter George Lowe, M.D.

#### MANUAL FOR THE VOLUNTEER MEDICAL SERVICE.

It may interest many of our readers to know that Surgeon-Captain Reginald Sleman, M.A., of the Army Medical Reserve and 20th Middlesex ("Artists") R.V., and Lecturer and Instructor Volunteer Ambulance School of Instruction, has brought out a small manual for the Volunteer Medical Service, to which are added chapters on the Army Medical Reserve and the Yeomanry Cavalry. It embodies a large amount of information within a small compass. The constitution of the Volunteer force, the formation of brigades and bearer companies, the appointment, rank and promotion of medical officers, the Army Medical Reserve, Yeomanry, Medical and Volunteer Medical Staff Corps, schools of instruction, duties of medical officers, camp hospitals and several other subjects are taken up and discussed. The information has not hitherto, so far as we know, been made ready and available in a small manual, and it is consequently likely to prove a useful aid to those interested in the medical services concerned.

#### NEW WATERWORKS AT BENARES.

Those of our military medical readers who know the big native city of Benares will be glad to hear of the opening of the waterworks there. There is probably no country in which the provision of wholesome water is more needed as a measure of public health than in India. The Indian Government cannot expend work and money in any better direction than in the improvement of the water-supplies of that country. We learn from the last *Weekly Pioneer* that the waterworks at Benares is a large undertaking. The total length of the pipe system is upwards of fifty miles and it is provided with 323 standposts in the public streets. The works are designed to afford a supply of twenty gallons per head of population in the sewered area and fifteen gallons in the unsewered area of the city. The system of wells generally adopted in India is a dangerous one. The natives are careless as regards their drinking water, but with facilities for obtaining a good wholesome supply of water in the public streets they will not be slow to avail themselves of it.

#### FEVER IN THE NORTH-WESTERN PROVINCES, INDIA.

The North-Western Provinces of Bengal have been unusually unhealthy this season. There is always a good deal of sickness in August and September, chiefly from malarial fever. We gather from the Indian papers that this year the death-rate in the North-Western Provinces for the month of September last has been nearly 130 per 1000.

#### PRACTICAL SANITARY PROGRESS IN INDIA.

Sir Auckland Colvin is to be congratulated on his successful efforts in the cause of sanitation and public health in India. He has recently had the satisfaction of seeing the Village Sanitation Bill and two other measures of a similar nature passed into law by a meeting of the local council at Allahabad.

#### LONG-DISTANCE MARCHES.

A military correspondent suggests that, as all competitions are liable to abuse, it would be advisable and prudent for a medical officer to inspect the men of each section during the march at stated intervals.

**ALEXANDRA PALACE.**—Great exertions are being made by the inhabitants of the northern suburbs of London especially to wrest the palace and its beautiful and spacious grounds from the grasp of the builder. A meeting was held a few days ago with this object and a proposition was moved and carried unanimously urging the County Councils of Middlesex and London to take such steps as they may think best to secure for the public the use and benefit of this desirable place of recreation and enjoyment.

## Correspondence.

"Audi alteram partem."

### "ABDOMINAL SECTION IN CERTAIN CASES OF PELVIC PERITONITIS."

To the Editors of THE LANCET.

SIRS,—I quite appreciate Dr. Elder's objection to the miscellaneous character of the cases reported in my paper at the Obstetrical Society. There can be no doubt it would have facilitated discussion if the series had been limited to cases of uncomplicated inflammatory disease of the uterine appendages. It would also have deprived the speakers who opposed the views for which I was contending of some of their most telling points. But when one has to decide in each individual case whether it shall or shall not be included in the list one realises the difficulty of classification and how purely arbitrary any classification of these cases must necessarily be. Take, for example, a case I operated upon the day before yesterday. There was a history of recurrent pelvic inflammation and there had been pus in the urine for five months. A mass was felt filling the right side of the pelvis and pushing the uterus against its left lateral wall—precisely the condition, in fact, that was and still is, by those unfamiliar with the teachings of modern pelvic surgery, supposed to be characteristic of cellulitis in the broad ligament. The diagnosis a previous experience of similar cases led me to make was salpingitis, with suppurating ovarian cyst, the latter communicating with the bladder. This diagnosis was confirmed in every particular. There was a suppurating cyst of the right ovary, three inches in diameter, communicating by a small fistulous opening with the bladder, and embracing the cyst, was an inflamed and adherent Fallopian tube. Dr. John Williams, if I understood him correctly, would have excluded that case from such a list as I prepared, on the ground of its being a new growth. But it was the *suppurative inflammation* of that new growth (due probably to infection from the adjacent tube) that necessitated the operation and was the occasion of its being performed. Ought such a case to be excluded or not? Rightly or wrongly, I came to the conclusion, in writing my paper, that it would be best, notwithstanding the obvious inconveniences of such an arrangement, to give the entire series of cases and classify them afterwards. Then, again, with regard to the mortality, if I had excluded tubercle and new growths and especially if I had excluded cases operated upon before I had acquired the requisite boldness and dexterity my mortality would have been exceedingly small. But by so doing I should have sacrificed honesty and should still have failed to disarm opposition. It would then have been open to objectors to point out the misleading character and scientific uselessness of long lists of successful operations and the ease with which statistics can by careful manipulation be made to prove anything.

I thank Dr. Herman for his excellent paper on the subject and Drs. Galabin and Elder for their interesting and valuable letters. The evidence brought forward by Dr. Galabin as to the mortality in cases not operated upon forms a contribution to the discussion of the very highest importance.

I am, Sirs, yours faithfully,

Brook-street, W., Dec. 10th, 1892. CHAS. J. CULLINGWORTH.

P.S.—The case above alluded to affords a further illustration of the truth of one of the propositions laid down in my paper—viz., "That it is safer to attack cases of pelvic suppuration from above than from below." The cyst contained two separate loculi, each of which was full of pus. Had an opening been made from below, either by means of the knife, trocar or aspirating needle, the result would have been that even if one abscess had been emptied the other would have been left untouched. Previously to the patient's admission an attempt had, indeed, been made to puncture the swelling from below, but fortunately the thickness of the cyst wall, by causing the instrument to bend up, prevented the intention from being carried out.

## ACCIDENT UNDER CHLOROFORM; RECOVERY.

*To the Editors of THE LANCET.*

SIRS.—A few brief notes on a case that might be called "apparent death from insufficient chloroform" may be useful. The patient, a strong man of about thirty, had a very large sarcoma of the testicle. Chloroform was at once given, according to our usual practice with new patients from a distance, although he had had a full meal. Chloroform was given slowly by a native assistant. The patient struggled when the first incisions were made and almost immediately began to retch and brought up a little rice. The stomach probably remained full. Up to this time he had taken about five drachms of chloroform, but after vomiting no more was put on the cap by the assistant. I was assisting Dr. Ernest Neve with the operation. A clamp was put on the cord and the tumour cut away. I had previously noticed great dilatation of the pupils. The patient now became rigid, almost in a state of opisthotonos; the face was blanched, no pulse or cardiac impulse could be felt and the breathing stopped. He was lifted at once off the table and put on the floor with legs raised. Artificial respiration was begun and was assisted by irregular gasping inspirations. The wound had ceased bleeding and the heart's action appeared to have stopped; several minutes passed. The clamp on the cord was loosened; dilute ammonia was injected into the arm and half a pint of hot water into the rectum. A slight colour now returned, though the pupils continued widely dilated and a feeble pulse could be felt. The operation was rapidly proceeded with and the wound stitched; sensibility began to return. Suddenly smart bleeding began, owing to retraction of the artery above the ligature on the cord. The wound had to be reopened. I then took charge of the chloroform myself and rapidly administered two drachms; the breathing became quiet and regular, the artery was found and ligatured, and the operation completed without any difficulty. I would call attention to a few points: (1) Although a good deal of chloroform was administered, it was obviously insufficient; (2) clamping the cord in a semi-anæsthetised patient who had just been vomiting produced shock which in the higher nervous organisation of a European might have proved fatal; (3) the patient bore the rapid administration of another full dose of chloroform when properly administered perfectly well and showed no signs of shock when the cord was religatured.

For over twenty-five years the extensive surgical work of this medical mission has been carried on without a single death under chloroform, which is the only anæsthetic employed. To what do we owe our immunity? Not to climate, for the temperature of the operating room from October to March is never above 50° and often below 40°; partly perhaps to the low nervous organisation of the natives and their perfect confidence in taking chloroform; chiefly, it would appear, to the sound principles on which it is administered, according to the rules laid down by Syme, although the actual administrators are always unqualified native assistants.

I am, Sirs, yours faithfully,  
ARTHUR NEVE, F.R.C.S. Edin.

Kashmir Mission Hospital, November, 1892.

## "THE TREATMENT OF SEVERE CASES OF CLUB-FOOT."

*To the Editors of THE LANCET.*

SIRS.—The relative values of (1) Dr. Phelps' method of treatment, (2) osteotomy and (3) the older plan (pressure by fixed bandages, splints and apparatus, coupled with tenotomy) can hardly be rightly estimated unless we consider a few points which have hardly been dealt with in recent discussions or correspondence. First, it should be kept in mind that when a case is cured by means of gradual moulding in plaster-of-Paris or other splints, in combination with tenotomy and the severing of any tight bands of fascia, the result is much better than after osteotomy. By the first method the bones have been changed in shape by degrees and the joints continue to be movable, while after osteotomy the foot is, as acknowledged by Mr. Walsham, "an imperfect member," and tarsectomy is "at the best ..... a bad job."

Two reasons for performing osteotomy have been given: first, that it is a remedy when all others have failed, or are supposed to be sure to fail; secondly, to cut short by one operation the tedious and lengthy process of the less severe

method. The first reason is of course unassailable, provided that the premisses are correct; but there can hardly be a doubt that some even of the most severe cases have been comparatively or actually cured without the cutting of bones. As to the second reason, I would submit that it is not quite a sound one. Patients who undergo osteotomy must be subjected to after treatment if relapses are to be prevented, and even if the whole length of such treatment is less than with other methods it is, to say the least, unfair to leave it out of consideration altogether. With regard to Dr. Phelps' operation also prolonged after treatment is necessary, and this fact was distinctly insisted on by Dr. Phelps when he read his paper at the International Congress at Copenhagen. There is another method for the treatment of severe cases which, if carefully applied, is most useful in reducing the deformity—I mean forced pressure with a wrench under an anæsthetic, regarding which operation I expect to deal more fully in a paper to be published very shortly. As the subject stands at present the osteotomists have yet to prove that removing large wedges from the foot or excising whole bones is the best plan of treatment for even the more severe cases of club-foot; and before we can accept Dr. Phelps' treatment as one to be largely adopted we ought, I think, to compare it very carefully as regards the permanent results with other methods, and especially with the forced reduction I have referred to above.

I am, Sirs, yours truly,

Queen Anne-street, Dec. 12th, 1892.

NOBLE SMITH.

*To the Editors of THE LANCET.*

SIRS.—Mr. Walsham writes of me in your last issue that my experience must differ considerably from that of others because I have stated that the condition of the bones of the tarsus at birth does not interfere with the reduction of talipes equino-varus. Having operated on many hundreds of such cases, I repeat that such is my opinion. It never has been my ill luck to be obliged to recognise that in a child of six weeks old, when the tendons are usually divided, the tarsal bones form a serious impediment to the reduction of deformity. Even should they be abnormal they are at that period easily moulded and brought into position and shape. The cause of relapse into deformity which so frequently occurs is that the posterior tibial tendon has not been divided. Scarcely a week passes that I have not occasion to prove this; either the tendon has been neglected or it has been missed. In such cases relapse is sure to occur later. But I have never known relapse to occur when the tibial tendons have been divided during the first few months of existence, where deformity has been entirely removed and where care has been taken to render and to keep the limb supple. I cannot therefore agree with Mr. Walsham in his opinion that in slight cases of equino-varus it is alone necessary to divide the tendo Achillis. But I willingly endorse that respecting tarsectomy—"at the best it is but a bad job."—I am, Sirs, yours faithfully,

Grosvenor-street, W., Dec. 12th, 1892.

B. E. BRODHURST.

## "EXPERIMENTS ON ANIMALS."

*To the Editors of THE LANCET.*

SIRS.—Mr. Lawson Tait, by his letter of Nov. 26th,<sup>1</sup> finds his experience as to sensitiveness of the peritoneum at variance with that of other surgeons generally. I must confess I am not an habitual reader of Mr. Tait's communications. I have, however, gathered that a want of agreement between his opinion and the opinion of other members of the profession is not a matter so remarkable as to excite comment from one, like myself, unable to offer an opinion on subjects purely surgical. Yet Mr. Tait's letter has been pointed out to me, and I would ask space to say that his opinion of the sensibility of the healthy peritoneum is contrary to knowledge he might have obtained by a little study of a science he just now affects to contemn. The peritoneum was shown by Haller in the experiments of his famous essay<sup>2</sup> to be quite insensitive to mechanical and many other modes of excitation. No doubt Mr. Tait's excuse for his mistaken observations and his contradiction of the well-established fact adduced by Dr. Gee is want of acquaintance with the physiological work achieved by Haller and Haller's pupils.

Mr. Tait's allusion to the peritoneum seems unfortunate for

<sup>1</sup> Brit. Med. Jour.

<sup>2</sup> De Partibus Corporis Hum. sentientibus &c., cf. p. 418, et alt. loca, Opera Minora, vol. i.

the position occupied by himself in the vivisection controversy. His allusion brings prominently forward (1) That a fact of importance was early ascertained by means of vivisection experiments; (2) that a person of Mr. Tait's acuity, oblivious to experimental results, has quite failed from clinical opportunities to obtain the fact for himself. From Mr. Harrison Cripps' letter I gather there are persons not a few who, having undergone surgical operations involving the peritoneum, can from memory of their own sensations further enlighten Mr. Tait. That the healthy peritoneum is a membrane sentient under mechanical interference is a dictum which Mr. Tait will, I imagine, find as difficult to substantiate before the surgeon as before humble followers of Haller's science like myself.

I am, Sirs, yours faithfully,  
C. S. SHERRINGTON, M.A., M.D.  
The Medical School, St. Thomas's Hospital, Dec. 7th, 1892.

## ROE V. NIX AND OTHERS.

To the Editors of THE LANCET.

SIRS,—The reports in the daily press of the proceedings in this trial, concluded yesterday, were very short, and a remark which, at the conclusion of my evidence, by permission of the learned judge, I made to the Court was not reported. May I venture to ask you to allow me to reproduce it in THE LANCET? In one of Miss Ellen Roe's letters read in court she said, referring to a visit of mine to her after she had made her will, that I had in joke asked her whether she had remembered Dr. Deas and myself in it. I stated to the Court that I had no recollection of having made this joke, but that if even in joke I had suggested the possibility of any medical superintendent or official visitor being guilty of an act of such grave professional impropriety as to accept a legacy under the will of an insane patient under their control, it was at best but a very poor joke and one which, if made, I should desire most emphatically to recall. I felt indebted to Mr. Justice Gorell Barnes for the great courtesy which permitted me to make this public disclaimer.

I am, Sirs, yours truly,  
C. LOCKHART ROBERTSON:  
Lord Chancellor's Visitors' Office,  
Royal Courts of Justice, Dec. 10th, 1892.

## LIGATURE OF THE EXTERNAL ILIAC.

To the Editors of THE LANCET.

SIRS,—In the report of Mr. Makins' case of Ligature of the External Iliac Artery by the transperitoneal method contained in your last issue, reference is made to the fact that I have also operated in the same way. The report goes on to say that "details of the case are wanting." I did tie the external iliac by the transperitoneal method in September last and, so far as the operation went, successfully, but as ten days later gangrene of the leg came on necessitating amputation, I have delayed publication of details until such time as the case is complete. I may perhaps be permitted to add that my reason for adopting the abdominal incision was that the position of the aneurysm rendered the ordinary operation impossible.

I am, Sirs, yours faithfully,  
W. H. BROWN.  
Leeds, Dec. 12th, 1892.

## "DEATHS UNDER CHLOROFORM."

To the Editors of THE LANCET.

SIRS,—I hope Dr. Van Someren's communication on this subject may meet with the notice which it deserves. It is not flattering to our national vanity that more deaths from chloroform should occur in England than elsewhere. Yet if the matter were fairly investigated perhaps it may be found that the desire to be extra-scientific was the cause of all these misfortunes. What can be more plausible than the supposition that mathematical exactness in the administration of anesthetics can be attained by the use of specially constructed "inhalers"? These complications are evidently at the root of the evil, and the only point wherein my experience differs from Dr. Van Someren's is as to the absolute safety of a folded towel. I do not doubt for a moment that many have used it, and can use it, without even the shadow of a mischance. But, alas, some are "duffers" and forget the possibility of a fold "going wrong" from the movements of the patient, or even from the manner of folding. As for

folded lint, it is simply an abomination. It has not stiffness enough in it to keep its shape, and the result is that in your very last issue a death from this cause at Birmingham has been recorded. By all means let the inhalers be "sent to the lumber room," and let the Italian method (taken from a German source) be adopted—viz., "the mask of Esmarch." This will retain its form in all hands, and can be slightly raised so as to admit more air when required. They have no personal knowledge of chloroform deaths in most Italian hospitals.

I am, Sirs, your obedient servant,  
EDWD. HAUGHTON, M.D.  
Spring-grove, Upper Norwood, S.W., Dec. 9th, 1892.

## THE RESULT OF THE ROYAL COMMISSION ON VACCINATION.

To the Editors of THE LANCET.

SIRS,—I have during the last four weeks vaccinated four infants. The vaccination officer of many years' standing has resigned. Would it not be as well to close all vaccination stations and await the result? The Commission would soon have some further demonstration of small-pox v. vaccination, which appears to be necessary. I have applied to my board two or three times to know if they consider it advisable to continue my services.

I am, Sirs, yours faithfully,  
WM. WOODWARD, M.D.,  
Public Vaccinator to the Worcester District.  
Worcester, Dec. 12th, 1892.

## THE TRICENTENARY CELEBRATION AT PADUA.

(FROM OUR SPECIAL CORRESPONDENT.)

TWENTY-SEVEN foreign and seventy Italian delegates, together with the Senatus Academicus and subordinate teaching staff of the University of Padua, attested the importance attached, not in Italy only but abroad, to the third centenary of Galileo's first lecture on mathematics in that seat of learning. The lateness of the season and its more than usual inclemency explain the non-attendance of many more than the actual representation; but Great Britain is fortunate in having such delegates as Professors Darwin and Norman Lockyer, while America could hardly have had a more accomplished, a more "academically minded" deputy than Professor William James of Harvard University, where he holds with such acceptance the chair of Psychology. While on this subject I may mention that the letter in which the public orator of Cambridge, Dr. Sandys, conveyed the greeting of his *alma mater* to the sister University has been greatly admired for its felicitous conception and for its Latin style. Niebuhr remarked that Italian scholars have an almost instinctive sense of Roman genius and Roman form which makes their criticism of modern Latinity peculiarly valuable. If such is the case, then Cambridge may be congratulated on the universal and unqualified eulogy which her public orator's letter has received from the compatriots of Livy.

Earlier in the proceedings than was expected took place in the "ufficio" of the Rector (the Commendatore Ferraris) the presentation of the *gonfalone* by the ladies of Padua, whose work and gift it was. The fine artistic banner now hangs in the Aula Magna of the University in testimony of the new life to which the womanhood of Italy has at length awakened, a life admirably illustrated on the 5th inst., when in the Scuola Normale Femminile the lady superintendent (the Signora Vittoria Wolf Bassi) gave a masterly lecture on Galileo and his place in the *role* of the sciences before an attentive and highly appreciative audience of her own sex. The lecture may be classed with those already signalled in THE LANCET by Professors Mosso and Celli, as indicating the healthy and ennobling influences under which the womanhood of Italy is now growing up.

At midday on the 6th the delegates, Italian and foreign, having been cordially received by the Rector in the Aula Magna, started on a tour of the city, the whole *cortège* being conveyed in twenty-five carriages. After the public monuments, including Galileo's house, had been duly honoured, an

interval of *riposo* was followed by the grand evening reception in the Casino Pedrocchi, where the magnificent hall displayed before the 400 guests a *coup d'œil* of surpassing splendour, the most attractive among its ornaments being the artistic reproduction in life-like detail of "Padua Antiqua" and "Padua Hodierna." Under the brilliant electric light the spectator saw for himself not only the native town of Livy, but the city familiar to the "Admirable Crichton," to Arthur Jonston, to William Harvey, and to countless British celebrities, whose education in science and in medicine, in whole or in part, was carried on in the Paduan school. The Minister of Public Instruction, Signor Martini, arrived at eleven o'clock, after having had to deliver, from the balcony of his hotel, an improvised but extremely happy address to the crowd below and his presence gave additional *clat* to an assemblage already unprecedentedly brilliant for the distinction of its constituents and the richness and variety of their costumes. There was a good deal of dancing—a peculiarly Venetian pastime—kept up till the more prudent retired to prepare for the very full and interesting programme of the 7th.

At midday the Aula Magna of the University was thronged in every part for the great commemorative celebration of Galileo. As the eye ranged over the sea of faces and figures it paused on the numerous foreign delegates in their characteristic vestments—the "toghe rosse" (red gowns) of the British representatives contrasting effectively with the different-coloured costumes of the professors from Paris or Nancy or of the Magyar professor, Lavegy, from Budapest. The first to command and then to break silence was the Rector, whose stately eloquence was followed by a written discourse from the competent pen of Professor Favaro, the well-known biographer and illustrator of Galileo. This splendid *éloge* will be made *publici juris*, when even more justice will be rendered to its merits than was conveyed in the prolonged plaudits amid which its author resumed his seat. These having died away, the foreign delegates succeeded—the admirable English discourses in which the congratulations of the Royal College of Physicians of London and of the Universities of Cambridge, Oxford, Edinburgh and Glasgow were expressed losing much of their effect by the strangeness of the language employed. The same must also be said of the speeches in German of the Rector of the University of Berlin, of the head of the Berlin Polytechnic and of the directors of the Polytechnic schools of Brunswick and Stuttgart. Much more intelligible and proportionately applauded was the fine Latin discourse of the Rector of Carlsruhe University. But the best received of all were the orations in Italian of the Russian delegate Professor Schourlo of Dorpat, of the Rector of Göttingen University, of the representatives of the Polytechnic institutions of the latter school and of Munich, as well as of the Swedish deputy. Signor Martini's discourse was also a finely conceived and nobly phrased piece of eloquence, after which the oratory was adequately kept up by the Syndic of Pisa and the representatives of the other Italian Universities. Then followed the honorary degrees conferred on the foreign deputies, among whom those of the English-speaking nationalities were not forgotten.

In the evening a sumptuous banquet was given to the Minister of Public Instruction and to the delegates, Italian and foreign, when once more the rhetorical element was not the least attractive feature of the symposium. A performance of "Hamlet" at the Teatro Verdi brought the memorable day to a close. The next day, the 8th inst., was the one set apart for the laying of wreaths on the statue of Galileo in the Piazza Vittorio Emanuele—a ceremony performed in procession, headed by an effective band. All the local technical and classical schools came next in order, and to these succeeded the Rector Ferraris conducting the students of the University of Padua as well as those of the other universities native and foreign. Conspicuous among the latter were the German, Swiss and Swedish *Burschenschaft* in their gay academic insignia and with swords drawn. The municipalities were next represented in the pageant, followed by the Italian and foreign professors, succeeded in turn by the civic band and the survivors of the Italian wars of unity and independence (1848-49, 1859-60, 1866-67 and 1870). A dense mass of the populace brought up the rear. One by one the wreaths were deposited on the statue of the hero of the day, after which the inevitable harangues were delivered with native-born eloquence—by Signor Marzolo in behalf of the Paduan Town Council; by another orator, whose name I did not catch, in behalf of the prefect; by Professor Galanti in behalf of the various institutes; and by a student of the University of Pisa.

This formed the official termination of the memorable "Tercentenario Galileiano"—a ceremony in which the intervention of the English-speaking *savants* gave manifest gratification to its Italian promoters. Galileo's mighty contemporary, Bacon, despite Hallam's well-known disparaging criticism, holds in Italian estimation a place equal, if not superior, to Galileo himself. Both share their reverence as concurrent forces in the revival of learning and the resurrection of science on inductive lines, and this twofold worship of theirs made peculiarly interesting the presence of delegates from the British and transatlantic schools. This *rapprochement* between the two nationalities will receive further strengthening from the great International Congress of Medicine and Surgery to be held in Rome next year, when Italy will again play the part of hostess with a cordiality and completeness all the more effective that she rehearsed the part at the grand Tercentenary Celebration at Padua, just consummated so brilliantly.

December 9th, 1892.

## LIVERPOOL.

(FROM OUR OWN CORRESPONDENT.)

### *The Assizes.*

IN sentencing the man Hale to his well-merited punishment of eighteen months' imprisonment with hard labour Mr. Justice Grantham characterised the fraud as the most impudent which had ever come before him. It was a sad sight to those who were in court to see witness after witness either chronically deaf or in a condition of perfect health detail their experiences of how they had been lured by the carefully worded advertisement to consult Hale and his undiscovered accomplice Miller. After parting with their hard-earned money they paid a second visit, only to find the so-called doctors gone. This mode of proceeding, repeated at Glasgow and Dublin and commenced at Belfast, formed a chain of evidence which could not be resisted. The prisoner was ably defended by Dr. Commins, but it was clear that there was no defence.

### *Opening of University College, Liverpool.*

The new buildings of University College in this city were opened yesterday by Lord Spencer, who was supported by a large and distinguished company. Great enthusiasm prevailed, the opening having been looked forward to for some time past with keen interest. The new buildings form a very imposing pile and add greatly to the architectural character of the many new public buildings recently erected here. Even the thoroughfare has acquired a classic appearance very different from that which it formerly wore, while the new Jubilee clock tower, which forms a very prominent feature of the new college, with its clock and chimes, will be useful as well as ornamental. Principal Rendall announced another donation of £1000 from Lord Derby; and the Right Hon. J. Bryce, M.P., Chancellor of the Duchy of Lancaster, in speaking at a banquet given by the Mayor at the Town Hall in the evening, announced that Her Majesty the Queen had been graciously pleased to bestow out of certain funds belonging to the Duchy of Lancaster the sum of £4000 upon the College. Lord Spencer unveiled a bust of Mr. Henry Tate, a liberal donor to the College, and was presented with a silver key to the Victoria Buildings by Mr. Edward Lawrence. It was a happy coincidence that Mr. Robert D. Holt should be the Mayor, he being a member of a family who have been most liberal contributors to the College.

### *The Blackburn Murder.*

The trial of Cross Duckworth, a brass finisher of Blackburn, aged thirty-two, for the wilful murder of a girl aged nine, was commenced on the 12th inst., occupying the whole of that and the next day. The medical evidence was given by Dr. Wheatley, police surgeon and medical officer of health for Blackburn. When he saw the body of the child soon after its discovery he found a handkerchief covered with blood firmly fixed in the mouth. There were several bruises on the child's face, blood flowed from the mouth, and the soft palate was partly torn from the hard palate. The base of the tongue and back of the throat were also lacerated, thus showing that much force must have been employed in pushing the handkerchief into the mouth. The left hand was covered with blood, while there was much on the right hand. There were no indications that the child had been violated. The evidence against the prisoner was circumstantial,

and was furnished by a large number of witnesses. The handkerchief found in the child's mouth resembled others found in the prisoner's house, and the cast of a boot mark in the ground near where the child's body was found corresponded with the boots worn by the prisoner. He was convicted and sentenced to death, the jury recommending him to mercy on the ground that they did not think the prisoner premeditated murder, but that it followed an attempt at outrage. It is greatly to be hoped that whatever may be the prisoner's fate it will act as a warning, this latter crime having been unhappily frequent of late.

#### *How Small-pox is Spread.*

Two women were fined by the stipendiary 40s. and 20s. respectively, with costs, for not notifying to the medical officer of health the existence of small-pox in their houses. The offence was aggravated in these cases by the fact that, although the health inspectors called at the house, the existence of disease was denied, though several children were palpably suffering from small-pox at the time. At last the women got alarmed, acknowledged the truth, and four patients were removed to the hospital. Other cases of small-pox occurring in the neighbourhood were traced to this house.

December 14th.

## NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

### *The Health of Railway Servants.*

It is stated that a circular has been issued by the General Manager of the North Eastern Railway with regard to the engagement of all new servants in the traffic department. In future a strict medical examination will be enforced on all persons wishing to enter the same and every five years the servants at the time in the employ of the company must subject themselves to a medical examination. In case of any accident occurring on the line all servants implicated therein must also subject themselves to medical examination and they will not be allowed to start work again unless they possess a certificate of competency.

### *Middlesbrough Asylum.*

Three sites have now been selected as suitable for the proposed lunatic asylum at Middlesbrough, and a committee has been appointed for the purchase of one of them.

### *A Child Suffocated by a Ball.*

An inquest was held in the Royal Station Hotel, on Friday, the 9th inst., on the body of a child aged eight months, who died at the house of its parents under the following curious circumstances. The child was lying on the previous day in its cradle, in which there was a transparent india-rubber ball. The latter seems to have come in two, and one half of it had got over the child's mouth, causing its death by suffocation. The verdict was in accordance with the above facts.

### *Workington Water-supply.*

Workington is about to receive an increase in its water-supply. The engineer, Mr. Taylor of Workington, has shown to a committee appointed for the purpose his plans, by which an addition of the purest water from Crummock of 15,000 gallons a day can be delivered to the town.

### *Small-pox in Durham.*

The inspector to the Local Board of Bishop Auckland reported a case of small-pox in the workhouse there last week. The patient was in the Local Board hospital and had tramped from a colliery in the district. He has also been tramping about the county for some time. This is by far the most common mode by which infectious disease is disseminated—namely, by tramps.

### *Outbreak of Hydrophobia in Wensleydale, Yorkshire.*

A rather serious outbreak of hydrophobia has occurred at a farm in Wensleydale. Some time ago a dog at the farm showed some signs of the disease, not however before it had bitten a beast. Both the dog and the bitten beast were shot, since then another bullock has been pronounced to be suffering from hydrophobia. A meeting of the Contagious Diseases (Animals) Committee of the North Riding has been called to consider the outbreak.

### *Scarlet Fever at Jarrow.*

Scarlet fever is now epidemic at Jarrow, and at present

there are twenty-eight cases in the hospital under treatment. Measles is also prevalent.

### *South Shields and the Importation of Small-pox.*

Reference was made at the last meeting of the South Shields Local Board to the importation of small-pox into the borough. It was stated that during the past five weeks three cases of small-pox had been imported, all the patients being sailors from a foreign port (Smyrna). Prompt isolation, with re-vaccination of exposed persons in several instances and special precautions as to disinfection, had prevented re-spread of the disease; and although the danger was not yet passed it was hoped that this most loathsome disease had been stamped out.

### *The Weather and Mortality of the Aged and Young.*

The late severe weather has considerably increased the death-rate, especially of the very young and aged. At Aspatria, Cumberland, the death of Mr. Erasmus Hinde took place last week in his one hundred and second year. It is said that till about a week of his death he was well, and even hearty, and in possession of all his faculties, and that his memory was marvellously good. There also died at Gateshead last week Mrs. Gifford Allan, at the age of ninety-five years. This lady was one of the oldest inhabitants of Edinburgh, and about twelve years ago she removed to Gateshead to reside with her son. Deceased was related to Sir Alex. Crichton, for several years physician at the Court of St. Petersburg and also to the late Sir Wm. Archibald Crichton, physician to the Emperor Nicholas.

Newcastle-on-Tyne, Dec. 14th.

## SCOTLAND.

(FROM OUR OWN CORRESPONDENT.)

### *The Edinburgh Medico-Chirurgical Society.*

THIS Society held its second meeting last week, Dr. Joseph Bell, President of the Society, in the chair. Among the exhibits were a vesicle calculus with paraffin forming its nucleus; an ulcerated vermiform appendix, shown by Dr. David Wallace; and an interesting specimen of an empyema which communicated with the œsophagus, the case doing exceedingly well until the child took measles and died, was shown by Dr. James Carmichael. Dr. Templeman of Dundee read notes on two rare cases of Sudden Death in Medico-legal Practice. The first was that of a man who had an altercation with his son for coming home late at night and died soon afterwards. The post-mortem examination showed that death had occurred with the heart in asystole, the left ventricle being full of blood. The heart muscle was believed to be normal and there was no atheroma and no lesion in any other organ. The second case was one of a woman who died soon after receiving a blow in the epigastrium, and in this case also the heart muscle was believed to be normal and the other organs were healthy, the only point noted being a congestion of the abdominal viscera. The probable immediate cause of death in each case was discussed and compared with recorded cases of a similar kind. In the second case Dr. Templeman inclined to the opinion that the blow led to a distension of the abdominal veins, which so reduced the blood pressure that the heart failed. Dr. David Wallace read an interesting and important paper on Cystoscopy in Relation to Vesical Neoplasms from notes of twenty-three cases, and illustrated part of his paper with a microscopical demonstration of sections of vesical neoplasms. He dwelt upon the great value of the cystoscope for diagnosis in the majority of cases and of the harmlessness of using it. He also pointed out its value for illuminating the interior of the bladder during operations on that viscus. Referring to the diagnosis of vesical neoplasms he and the subsequent speakers agreed that hæmaturia without evidence of inflammation was pathognomonic of their presence. The conclusions drawn in the paper were supported by Mr. John Duncan and Professor Chiene. Dr. Ramsay Smith read notes of a Case of Acquired Umbilical Fœcal Fistula, and some discussion took place on the causes which might produce the condition. The Society decided to hold a special meeting on Wednesday, the 21st inst., to consider what steps should be taken with reference to a hall in which the Society should hold its meetings.

*Sanitation in Loochmaben.*

It appears that the Police Commissioners of this burgh as the local sanitary authority had obtained a report on the condition of the burgh from Dr. Chalmers' assistant sanitary medical officer for Glasgow, the report being intended as a reply to that by the Board of Supervision's inspecting officer. The report stated that the death-rate from enteric fever was thrice that of Glasgow and from phthisis nearly double. The prevalence of these diseases gave the burgh an unenviable prominence and led to the conclusion that its present condition was such as to cause great anxiety, and that the high death-rate from enteric fever could not be dissociated from the system of wells in the burgh. As a consequence there was urgent necessity for a water supply being provided which should be beyond the risk of contamination. A publicly-signed petition was presented signed by three-fourths of the ratepayers, traversing some of the statements in the report by the Board of Supervision, and this had been signed by most of the Commissioners. There appear to have been some animated scenes during the meeting, and many of the citizens and their representatives evidently think that as their fathers had drunk of the wells so ought they. This same battle is being fought in other places in Scotland and will have to be fought in many more, and the medical officers of health will require all the courage which a strong moral support from their brethren can give them, to go on steadily and perseveringly fighting against local prejudice and ignorance. The first generation of health officers in our counties have much trying but important and valuable pioneer work to do, and their hands must be upheld in the doing of it.

December 13th.

## IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

*The Meath Hospital, Dublin.*

By the regretted resignation of Dr. Foot, senior physician to this hospital, from ill health, a vacancy for a physician took place which the Medical Board have filled up by electing Dr. James Craig. Dr. Foot, who has been physician to one of the principal hospitals in Dublin for over twenty years, was educated at the Meath, was curator of the pathological museum, and succeeded the late Dr. Alfred Hudson as visiting physician in 1871. His withdrawal from the hospital will be a great loss, as he was an excellent clinical teacher and his reputation brought many pupils to the institution. Dr. Craig, late clinical assistant to the physicians and assistant physician to the National Children's Hospital, is a graduate in arts, medicine and surgery of the University of Dublin.

*Visiting Physicians to Cork Union Workhouse: Age Qualification.*

The Cork guardians at a recent meeting adopted a resolution in reference to an advertisement for a physician to the workhouse, to the effect that no medical man of less than ten years' experience of his profession would be eligible for the office of visiting physician to Cork Union. This announcement caused considerable indignation among the medical profession in Cork, and at a meeting held they came to the conclusion that the adoption of such a rule would be injurious to the best interests of the patients and unfair to many well-qualified and eligible candidates. Independently of this protest Article 33 of the Local Government Board's General Order, dated December 1882, would prevent any undertaking of the kind proposed by the guardians being carried out, and would necessarily cause a fresh election for a physician to be held; but the guardians having seen their error, have rescinded the objectionable rule as to age, and substituted another advertisement.

*Eye, Ear and Throat Hospital, Cork.*

Last year 409 intern patients and 3245 extern cases received treatment at this hospital. There was no death. A large number of students attended the hospital and courses of evening lectures were delivered regularly in the more theoretical subjects, with demonstrations in the use of the ophthalmoscope, laryngoscope and other methods of diagnosis. The amount received from private patients was £332, but the year closed with a debt of £380.

*A Singular Challenge.*

Dr. John Roche, of Kingstown, in a communication to a

Dublin newspaper states that, in order to show the non-injurious properties of bacilli, he is willing to swallow any quantity of the so-called typhoid bacilli and to take any volume of the tubercle bacilli, if from clean cultures, in order to let humanity perceive that, so long as other things are equal, the so-called specific bacilli are of no moment.

*Insanitary Condition of Kilkenny.*

Mr. Stafford, Medical Inspector, Local Government Board, has reported upon the very insanitary state of this town and upon the urgent necessity of a supply of pure drinking water. Typhus fever has been prevalent for some time past, the accommodation of the lower classes is insufficient, and the sewerage and general cleansing operations are stated to be very defective.

*Case of Small-pox.*

A case of small-pox, which appears to have been contracted in England, was recently admitted into Cork-street Fever Hospital.

*The Ulster Medical Society.*

At a meeting of the Ulster Medical Society held on Wednesday, Dec. 7th, papers were read by Dr. Alexander on Uterine Hydatids, and by Dr. Henry O'Neill on the Uses of Methylene as an Anesthetic and the Method of its Administration. An interesting discussion followed the reading of both communications.

*The Ulster Hospital for Women and Children.*

On Monday the Duchess of Abercorn opened a grand bazaar and fancy fair, promoted on behalf of the Ulster Hospital for Women and Children. Recently the hospital has been removed to a more commodious building in Ballymacarret, on the co. Down side of the Lagan. In securing and furnishing their new institution a good deal of outlay has taken place and the bazaar was organised to raise £2000 so as to relieve the committee of the burden of debt. I understand that the bazaar has been very successful.

*Deaths in the Profession.*

Two members of the profession have died recently—Mr. Thomas Ball, who has for some time been in practice in Belfast, and Dr. Jamison, who was for a very lengthened period dispensary medical officer in Newtownards. He was succeeded in the Poor-law appointment some years ago by his son.

*Belfast Medical Students' Association.*

At the opening meeting of this flourishing Association held at Queen's College on Friday, Dec. 9th, Dr. Mitchell (outgoing president) introduced his successor, Dr. J. S. Morrow, who delivered his inaugural address, and amongst other matters referred to the fact that in hospital work in Belfast clinical material was deficient in certain departments. He said a strenuous effort would be made this session by that Association to have the Union Hospital recognised for clinical instruction, where those special forms of disease were to be seen, and where there was a wide field for clinical instruction. The Rev. Dr. Hamilton, President of Queen's College, Belfast, said, at the conclusion of Dr. Morrow's address, that he believed that the attempt now being made to have the Union Infirmary recognised for teaching purposes seemed to be more likely to reach a successful issue than ever before. The Society could rely on his influence and support in the matter. He also announced that the Students' Union Fund was now between £3000 and £4000, and suggested that the students should show their interest in the scheme in some tangible manner. It was then decided that this year there should be a united conversazione given by the Medical Students' Association and the Literary and Scientific Society.

*Election of Medical Officers at the Belfast Union.*

Dr. E. C. Bigger was on Tuesday last unanimously elected medical officer to the Belfast Union Hospital and Dr. Hare was on the same day chosen by a large majority as medical officer to the union infirmary.

Mr. William Frazer, F.R.C.S.I., of Dublin, has been elected an honorary member of the Society of Antiquaries of Scotland, which limits its honorary members to twenty-five.

Mr. F. Brannan, M.B., has been appointed house surgeon to St. Michael's Hospital, Kingstown.

The death is reported of Mr. William Scott, J.P., F.R.C.S. Edin., at his residence, The Bawn, Aghnacloy, County Tyrone, aged seventy-five years.

December 13th.

## PARIS.

(FROM OUR OWN CORRESPONDENT.)

*Passage of Microbes through the Placenta.*

At a recent meeting of the Biological Society M. Anché of Bordeaux made known the result of certain researches he undertook into this subject. Two women, one of whom was pregnant three months and a half, the other two months, were attacked with small-pox and as a result aborted. In the blood and liver of the foetus of the former was found the streptococcus pyogenes; in the latter the staphylococcus pyogenes aureus. Both these patients succumbed. In the blood and viscera of the first was found the same micro-organism as in the foetus, while the staphylococcus was observed in the blood of the second. These observations are of interest not simply as illustrating the passage of micro-organisms through the placenta—a fact which had been previously ascertained in other affections—but because this was the first time that such a thing was noticed in small-pox. They were also suggestive as probably explaining certain hitherto obscure causes of abortion and death of the mother, without apparent secondary infection through the uterine passages.

*Urea and Urinary Bacilli.*

Achard and Renault, as a result of their inquiries in this direction, find that urine, when containing urinary bacilli, remains acid in reaction with no trace of ammonia or its carbonate. They further observe that pure solutions of urea will hardly, if at all, cultivate the bacillus. But in solutions of urea rendered nutritive by the addition of pancreatic peptone the bacilli grow well in a solution with a proportion of 1 per cent. of urea. Their evolution is less marked in a 3 per cent. solution and hardly at all in one of 5 per cent. At the same time it was found that the microbes lost their force and their property of giving a reaction with indol, this reaction being usually well marked in cultivations in pancreatic peptone. The conclusion arrived at by these observers is that urea does not serve for the nutrition of urinary bacilli, and that even when in very feeble proportion it retards and finally prevents their development.

*The Bacillus of Acute Rheumatism.*

M. Lucatello of Genoa claims to have discovered the microbe of articular rheumatism. At the recent Medical Congress in Italy he showed several cultures at different periods of their development and in various media of a micro-organism which he had succeeded in isolating in two cases of articular rheumatism. In one case it was found in the blood, the spleen and in an infiltrated ganglion situated near the affected joint; in the other it was obtained from the effused fluid in the knee-joint. He describes it as small and round, staining indifferently by Löffler's liquid, and not developing either in the air or in blood plasma. *In vitro* it will only grow under fairly thick layers of some solid substance or oil, in hydrogen or in vacuo, at a temperature of 37° C. It has no pyogenic or saprogenic properties.

*Presentation to Professor Pasteur.*

The medical section of the Academy of Sciences has decided that the friends and admirers of M. Pasteur will meet on Tuesday, Dec. 27th, in the large amphitheatre of the Sorbonne at half-past ten in the morning, in order to present him with a souvenir of his seventieth birthday. This will consist of a gold medal engraved by M. Roty, one of his fellow-academicians. On one side the medal will bear an effigy of the recipient, and on the other the following inscription: "To Pasteur, on his seventieth birthday—homage of science and humanity—Dec. 27th, 1892."

December 14th.

## Obituary.

## WM. AUGUSTUS MAYBURY, M.R.C.S., L.S.A.

On the 10th inst., William Augustus Maybury, M.R.C.S., L.S.A., passed peacefully away at his residence, Cedar Lodge, Frimley, Surrey, in the presence of several members of his family, after an illness borne with singular patience, fortitude and resignation, at the advanced age of eighty-three. He was born at Cleady, Kenmare, co. Kerry, and in his early manhood came to England, when he pursued his medical studies at Westminster Hospital under the celebrated sur-

geon, Guthrie, and at St. Thomas's under Le Gros Clarke, South, Green, Solly and Simon. In 1836, he married Miss Clara Constable, younger daughter of Mr. Jas. Constable of Storrington, Sussex. For twelve years he practised in Little Tower-street, London, and then removed to Frimley, where he continued to follow his profession for a period of over forty years, having at one time held the post of medical officer to the Frimley district of the Farnham Union. He belonged to the old school of practitioners now almost extinct and was a man of indomitable energy and perseverance. He has left behind him his widow, five sons (all in the medical profession) and two daughters to mourn their irreparable loss.

INSPECTOR-GENERAL D. L. MORGAN, C.B., R.N.,  
M.D., F.R.C.S. Eng.

THE death is announced of Dr. David Lloyd Morgan, C.B., of Rhôsmaen, near Llandilo, which took place on the 3rd inst. Dr. Morgan was born at Rhôsmaen in 1823. He studied at the London Hospital and took his M.D. degree at St. Andrew's University. He was also a Fellow of the Royal College of Surgeons of England. In 1846 he entered the Royal Navy and finally became Inspector-General in the Naval Medical Service in 1877. The late officer had a distinguished career and a large amount of war service. He served on the West Coast of Africa, in the Mediterranean and Black Sea, and was present at the operations against Sebastopol, after which he was specially promoted and received the Crimean and Turkish medals. Later he served with the land forces in China and was present at the capture of Canton, Cheking and the Taku Forts, again receiving a medal and a special commendation. From 1862 to 1865 he was senior medical officer of the flagship *Enryalus* in Japan and China. As senior medical officer of the flagship *Royal Alfred* he served in the West Indies, and as Deputy Inspector-General at Bermuda, Hong Kong and Chatham. He received the Blane medal in 1871 and was made C.B. in the same year. Later he became Inspector-General at Plymouth and the Royal Hospital, Haslar. He was a Hon. Physician to Her Majesty the Queen.

## PROFESSOR JOHANN GEORG JOESSEL.

Professor Joessel of Strasburg died last Wednesday. An Alsatian by birth, he was one of the professors of the medical faculty in Strasburg before the Franco-German war and was appointed to one of the two professorships of anatomy in the new university there, which was founded in 1872. His province was descriptive anatomy. His chief work was the unfinished "Lehrbuch der Chirurgisch-Topographischen Anatomie" ("Manual of Surgico-Topographical Anatomy"). The first part, which treats of the limbs and the breast, appeared in 1884. His age was fifty-four.

## Medical News.

## ROYAL COLLEGE OF SURGEONS OF ENGLAND.—

The following gentlemen have passed the necessary examinations, and having conformed to the by-laws and regulations, were, at the ordinary meeting of the Council, admitted Fellows of the College:—

- Doyle, Robert Walter, L.S.A., St. George's Hospital and Bristol Royal Infirmary; diploma of Member dated July 27th, 1890.  
 Robinson, William, M.D. Durh., Durham University and Middlesex Hospital; July 20th, 1881.  
 Childs, Charles Plumley, L.R.C.P. Lond., King's College Hospital; July 19th, 1883.  
 Thomas, J. Lynn L.R.C.P. Lond., London Hospital; Jan. 20th, 1886.  
 Edridge-Green, Frederic Wm., M.D. Durh., L.R.C.P. Lond., St. Bartholomew's Hospital and Durham; June 27th, 1887.  
 Olive, Eustace John Parkes, M.B. Cantab., L.R.C.P. Lond., Cambridge University and St. Bartholomew's Hospital; Nov. 14th, 1889.  
 Foster, W. Jas., L.R.C.P. Lond., St. Mary's Hospital; Feb. 13th, 1890.  
 Gray, Thomas Campbell, L.R.C.P. Lond., Bristol General Hospital; May 8th, 1890.  
 Hallidie, Andrew Hallidie Smith, M.B. Cantab., L.R.C.P. Lond., Cambridge and London Hospital; May 8th, 1890.  
 Hopkins, George Herbert, L.R.C.P. Lond., University Colleges, London and Liverpool, May 8th, 1890.  
 Thomas, John Llewellyn, L.R.C.P. Lond., St. Bartholomew's Hospital; May 8th, 1890.  
 Collum, Archie Tillyer, L.R.C.P. Lond., Charing-cross Hospital; July 28th, 1890.  
 Preston, Charles Henry, M.B., L.R.C.P. Lond., Manchester Royal Infirmary and London Hospital; July 28th, 1890.  
 Griffith, William Stokes, M.B. Cantab., L.R.C.P. Lond., Cambridge and St. Thomas's Hospital; Nov. 13th, 1890.  
 Mole, Harold Frederic, L.R.C.P. Lond., Bristol Royal Infirmary and St. Bartholomew's Hospital; Nov. 13th, 1890.  
 Wyman, Cuthbert, M.B. Cantab., L.R.C.P. Lond., Cambridge and St. Thomas's Hospital; Feb. 12th, 1891.

Four other gentlemen passed the examination, but not having attained the legal age (twenty-five years) will receive their diplomas at a future meeting of the Council. Twelve were referred.

The following gentleman having previously passed the necessary examinations, and not having attained the legal age, was also admitted a Fellow of the College:—

Marshall, Charles Devereux, L.R.C.P. Lond., University College Hospital diploma of Member dated July 28th, 1890.

The following gentlemen were admitted Licentiate in Dental Surgery:—

Allworth, F. Parnell, Guy's Hosp.	Kershaw, Geo., Manchester.
Apthorpe, S. Ralph	Martin, G. W., Liverpool.
Baly, C. F. P., Univ. Coll. & Dent. Hosps.	Mordaunt, F. G., Ch.-cr. & Dent. H.
Blain, E. J., Char.-cr. and Dental Hosps.	Mosely, Edward, "
Blewitt, F. J., Guy's Hosp.	Northcroft, George, "
Danolds, H. G., Ch.-cr. & Dent. H.	Osborn, Lewis J., Liverpool.
Fennings, F. J., "	Parris, R. S., Ch.-cr. & Dent. H.
Fitter, Septimus, Birmingham.	Ranken, John G., "
Fouraker, F., Char.-cr. & Dent. H.	Read, C. Scholefield, "
Gabell, Douglas P., "	Roberts, H. Trist, "
Gardner, C. Smith, "	Steele, T. Barton, "
Goodman, Wm. H., "	Stevens, Herbert J., "
Harrison, Philip, Guy's Hosp.	Tisdall, Chas. Jas., "
Henry, A. R., "	Townend, E. Francis, "
Hilder, A. T., Birmingham.	Turner, Harold A., Guy's Hosp.
Hope, A. C., Middlx. and Dental.	Watson, F. E., Middx. & Dent. H.
Johnson, H. W., "	Weston, E., Ch.-cr. & Dent. Hosp.
	Whittles, J. D., Birmingham.
	Woodcock, R. E., Guy's Hosp.

Thirteen gentlemen were referred, twelve for six months and one for one year.

UNIVERSITY OF CAMBRIDGE.—At a congregation held on Dec. 8th the following degrees were conferred:—

*Doctors of Medicine*.—Charles Forbes Harford-Battersby, Trinity; Edward Collingwood Andrews, St. John's; Joseph Squier Hinnell, Pembroke.

*Bachelors of Medicine and Bachelors of Surgery*.—John Basil Hall, Pembroke; Joseph John Perkins, Emmanuel.

BROMPTON HOSPITAL.—The report of the committee of management, read at the quarterly Court of Governors on the 25th ult., gave details of the nature of the work effected in renovating the building and in enlarging the chapel. Ninety-three in-patients had been sent to the convalescent home at Sandgate for a month. The number of patients admitted since Aug. 4th had been 512. The committee appeal for increased support.

ROYAL INSTITUTION.—The following are the lecture arrangements before Easter:—Sir Robert Stawell Ball, six lectures (adapted to a juvenile auditory) on Astronomy; Professor Victor Horsley, ten lectures on the Brain; the Rev. Canon Ainger, three lectures on Tennyson; Professor Patrick Geddes, four lectures on the Factors of Organic Evolution; the Rev. Augustus Jessopp, three lectures on the Great Revival—a study in Mediaeval History; Professor C. Hubert H. Parry, four lectures on Expression and Design in Music (with musical illustrations); the Right Hon. Lord Rayleigh, six lectures on Sound and Vibrations. The Friday evening meetings will begin on Jan. 20th, when a discourse will be given by Professor Dewar on Liquid Atmospheric Air. Succeeding discourses will probably be given by Mr. Francis Galton, Mr. Alexander Siemens, Professor Charles Stewart, Professor A. H. Church, Mr. Edward Hopkinson, Mr. George Simonds, Sir Herbert Maxwell, Bart., the Right Hon. Lord Rayleigh and other gentlemen.

REQUESTS AND DONATIONS TO HOSPITALS.—Mr. Herbert Ellis, late of the Priory, East Farleigh, Kent, bequeathed £200 each to the West Kent General Hospital and the Kent County Ophthalmic Hospital at Maidstone.—The Worshipful Company of Mercers has granted a donation of £52 10s. to the Hospital for Epilepsy, Regent's-park.—The entertainment given at St. George's Hall, Langham-place, London, on the 29th ult. by the "Strolling Players" resulted in the sum of £100 being handed over to the funds of the Surrey Convalescent Home at Seaford.—The Royal Portsmouth Hospital has received an anonymous gift of £1000.—A legacy of £5000 (duty free) has been received by the Governors of Middlesex Hospital from the late Mr. James Stewart Forbes.—The late Mr. W. C. Asquith, of Colne, bequeathed £100 to the Victoria Hospital for Burnley and district.—A donation of £100 has been forwarded to the Royal Sea Bathing Infirmary for Scrofula, Margate, by the executor of the late Mrs. E. Holm.—Mrs. Cleavor, late of Beverley, bequeathed, duty free, £500 to the Beverley Cottage Hospital.—Mr. John McCormick left £500 to the City of Dublin Hospital. The Duke of Leinster has given £50 to the building fund of the Rotunda Lying-in Hospital.

ATHLONE WATERWORKS.—The Town Commissioners have approved of a plan for waterworks for the town, at an expenditure of £3500.

FOOTBALL CASUALTY.—During a match at Shottersmill, Surrey, on Saturday the 3rd inst., one of the East Molesey "backs" collided with a player of the home team, the latter sustaining a fracture of the clavicle.

HOSPITAL SATURDAY FUND SPORTS.—The council of the above fund have decided to organise cycle and athletic sports in 1893 on behalf of the medical charities of the metropolis. Many gentlemen well known in the athletic world have consented to assist.

MEDICAL PROTECTION.—A meeting of the council of the London and Counties Medical Protection Society was held at Harley-street on the 1st inst., Dr. Heron being in the chair. Some financial and other business was disposed of and Dr. Mead reported good progress in organising new districts.

INSANITARY BOARD SCHOOL AT LAMBETH.—The adjourned hearing of the summons against the London School Board was resumed at the Southwark Police-court on the 14th inst. Since the last hearing the Board had appointed a committee to visit the Johanna-street schools and to ascertain whether there were any grounds for closing them. The committee had reported that there was not sufficient cause to justify the closing of the schools. The Board having complied with the notices served upon them the vestry did not press for a penalty; but the presiding magistrate, Mr. Marsham, ordered the Board to pay £5 5s. and costs, remarking that there had been considerable neglect and delay in paying attention to the sanitary condition of the school.

METROPOLITAN ASYLUMS BOARD.—The number of patients remaining in the several fever hospitals of the Metropolitan Asylums Board at midnight on Dec. 13th was as follows:—Eastern Hospital, 342 scarlet fever, 59 diphtheria and 39 enteric fever; North-Eastern Hospital, 487 scarlet fever; North-Western Hospital, 352 scarlet fever, 87 diphtheria and 19 enteric fever; Western Hospital, 272 scarlet fever, 32 diphtheria, 1 typhus fever and 16 enteric fever; South-Western Hospital, 284 scarlet fever, 52 diphtheria and 18 enteric fever; South-Eastern Hospital, 351 scarlet fever, 16 diphtheria and 15 enteric fever; Northern Hospital, 878 scarlet fever and 9 diphtheria; Gore Farm Hospital, 716 scarlet fever. On the hospital ship *Atlas* there were 31 cases of small-pox.

MEDICAL DEFENCE UNION.—A local committee of the Union was recently established in Liverpool, consisting of the following gentlemen:—Drs. Carter (chairman), Barr, Costine, Cregeen, Macfie Campbell, G. Stopford Taylor and Mr. Robert Jones. Honorary secretary: Mr. Richard Williams. On Dec. 5th a public meeting of the profession was held at the Medical Institution, Dr. Carter in the chair, when Dr. Leslie Phillips, one of the general secretaries of the Union, was present, and explained the objects and position of the company. In reference to the proposal to elect alternately a metropolitan and provincial chairman of the Union, the meeting was unanimously of opinion that such a course would be detrimental to the best interests of the Union at the present juncture. At the close of the meeting several gentlemen handed in their names to be enrolled as members.

MEETING OF THE METROPOLITAN ASYLUMS BOARD.—At the meeting of the managers on the 10th inst., the death of Mr. H. Seymour, one of the original members of the Board, was announced, and great sympathy with the members of his family was expressed. Afterwards the return of fever patients in the various district hospitals was read, by which it appeared that for the two weeks ending the 8th of this month, the total number of cases of scarlet fever was 3774, as compared with 3874 for the preceding fortnight; the cases of diphtheria were 250 as against 269, and the enteric fever cases numbered 115, as against 112 for the same corresponding period. A conversation took place on the need of more accommodation for doubtful cases of small-pox patients and the question was referred to a special committee. Finally, in view of a report from the British Dental Association concerning the condition of the teeth of the boys of the training ship *Exmouth*, the committee had decided to appoint a qualified dental surgeon for about six weeks at a remuneration of four guineas a week.

## Appointments.

Successful applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.

ALLAN, F. J., M.D. Edin., D.P.H. Camb., has been appointed Medical Officer of Health for the Strand Sanitary District, vice Evans.  
 ALLEN, J. D. C., M.B., C.M. Edin., has been appointed House Surgeon to Noble's Isle of Man Hospital, Douglas.  
 ANDRÉ, J. E. F., L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer for the manhood Sanitary District of the Westhamphett Union.  
 BARRETT, R. H., L.R.C.P. Lond., M.R.C.S., has been reappointed Medical Officer for the Second and 3rd Sanitary Districts of the Wisbech Union.  
 BOYD, J. ST. CLAIR, M.D., M.Ch. Irel., has been appointed an Honorary Physician to the Samaritan Hospital, Belfast.  
 CAMPBELL, JOHN, F.R.C.S. Eng., M.A., M.D., M.Ch., & M.A.O. Irel., has been appointed Surgeon to the Samaritan Hospital for Women, Belfast.  
 COPLEY, W. H., L.R.C.P. Lond., M.R.C.S., has been reappointed Medical Officer for the Seventh Sanitary District of the Wisbech Union.  
 CRAIG, J., M.D., B.Ch., M.R.C.P. Irel., has been appointed Physician to the Meath Hospital, Dublin.  
 CLEASY, ROSE, L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer for the Windlesham Sanitary District of the Chertsey Union.  
 CULROSS, J., M.B., C.M. Glasg., has been appointed Medical Officer for the Newton Abbot District of the Newton Abbot Union.  
 CUTCLIFFE, MONTAGU, L.R.C.P., M.R.C.S., has been appointed Assistant House Surgeon to the Devon and Exeter Hospital, vice Abram, resigned.  
 FROST, J. K., M.R.C.S., has been appointed Medical Officer for the Madley Sanitary District of the Dore Union.  
 GILBERT, H. P., L.R.C.P. Edin., M.R.C.S., has been reappointed Medical Officer for the Eleventh Sanitary District of the Wisbech Union.  
 GROOM, WM., Jun., M.D. Camb., M.R.C.S., has been reappointed Medical Officer for the Newton and Tydd, St. Giles Districts of the Wisbech Union.  
 GROOM, WM., Sen., M.R.C.S., L.M., has been reappointed Medical Officer for the Eighth Sanitary District of the Wisbech Union.  
 GÜNTHER, THEODORE, M.D. Tübingen, L.R.C.P. Lond., has been reappointed Medical Officer of Health for the Hampton-Wick Sanitary District.  
 JONES, ROBERT, M.D. Lond., B.S., F.R.C.S. Eng., L.R.C.P. Lond., L.S.A., has been appointed Medical Superintendent of the London County Council's New Asylum at Claybury.  
 LLOYD, EVAN, M.B., C.M. Glasg., has been reappointed Medical Officer of Health for the Rural Sanitary District of the Tregaron Union.  
 MARSHALL, R. J., M.B., C.M. Glasg., has been appointed Deputy Medical Officer for the Iver Sanitary District of the Eton Union.  
 MASON, GEORGE, M.R.C.S., has been reappointed Medical Officer for the Ninth Sanitary District of the Wisbech Union.  
 MULCAHY, T. A., L.R.C.S., L.R.C.P. Irel., has been appointed medical officer to Barrington's Hospital, Limerick.  
 OSBURN, H. B., L.R.C.P. Lond., M.R.C.S., D.P.H. Camb., has been appointed Medical Officer for the Bagshot Sanitary District of the Chertsey Union.  
 PETHICK, C. S., M.B. Camb., L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer for the Woolton Sanitary District of the Prescott Union.  
 RUSSELL, J. S. RISIEN, M.B., M.R.C.P., has been appointed Assistant Physician to the Metropolitan Hospital.  
 SINCLAIR, F. H., M.D., M.Ch., L.R.C.P., L.R.C.S. Irel., has been reappointed Honorary Attending Physician to the Belfast Hospital for Consumption and Diseases of the Chest.  
 STACK, E. C., L.R.C.P., L.M., L.R.C.S. Irel., has been appointed Honorary Attending Surgeon to the Belfast Hospital for Consumption and Diseases of the Chest.  
 TATHAM, E. J., M.D., B.C. Cantab., M.R.C.S., has been appointed Medical Officer for the Hales-Owen Sanitary District of the Stour-bridge Union.

 UNIVERSITY OF EDINBURGH.—Five Examiners.  
 UNIVERSITY OF GLASGOW.—Assistant Examiner in Zoology. Salary £30 per annum.  
 WEST HERTS INFIRMARY, Hemel Hempstead.—House Surgeon and Dispenser, who shall also be Assistant Secretary, for two years. Salary £100 per annum, with board, furnished rooms, free light, attendance and washing.

## Births, Marriages and Deaths.

### BIRTHS.

CANTLE.—On Dec. 13th, at The Peak, Hong Kong, the wife of James Cantle, F.R.C.S., of a son.  
 CARTER.—On Dec. 10th, at Glenholme, Upper Richmond-road, Putney, S.W., the wife of Frederick H. Carter, F.R.C.S. Eng., of a son.  
 CREGGH.—On Dec. 12th, at St. George's, Bermuda, the wife of Surgeon-Captain S. H. Creggh, A.M.S., of a son.  
 DAVIES.—On Nov. 30th, at Penrill, Machynlleth, North Wales, the wife of Alfred O. Davies, M.R.C.S., of a son.  
 HAMILTON.—On Dec. 6th, at Prince's avenue, Liverpool, the wife of R. J. Hamilton, M.R.C.S., of a daughter.  
 KAY.—On Dec. 2nd, at Bentley Cottage, Bentley, Hants, the wife of William Kay, M.R.C.S., L.S.A., of a daughter (stillborn).

### MARRIAGES.

SMART—CADDY.—On Nov. 20th, at St. Luke's, Richmond, William Herbert Smart, M.A., M.B. (Cantab.), of Polesworth, Warwickshire, only son of the late Sir William R. E. Smart, K.C.B., M.D., Inspector General R.N., to Florence, elder daughter of Dr. Caddy, Deputy-Inspector-General (retired) R.N., of Charterhouse, Lion Gate gardens, Richmond.  
 THOMSON—RATCLIFF.—On Dec. 8th, at the Church of Holy Trinity, Ashby-de-la-Zouche, by the Rev. A. Beauchamp St. John, David Thomson, L.R.C.P. Edin., L.R.C.S. Edin., L.F.P. and S. Glas., to Alice Emma, third daughter of the late Samuel Ratcliff, Highfields, Ashby-de-la-Zouche.  
 WOOD—WALTON.—On Dec. 8th, at St. Andrew's Church, Southport, by the Rev. Canon Cross, D.D., assisted by the Rev. Wm. Wood, M.A., brother of the bridegroom, Arthur Wood, M.B. and C.M., of Southport, to Fanny, second daughter of the late Joseph Brice Walton, Esq., of Leonard House, Southport, and formerly of Sowerby Bridge, Yorks. Edinburgh graduates of 1837 please note.

### DEATHS.

AVEILING.—On Dec. 12th, at Upper Wimpole-street, Cavendish-square, James H. Aveling, M.D., aged 64.  
 FURLEY.—On Dec. 6th, at Church-road, St. Leonards-on-Sea, Edward Furley, M.D., aged 80, formerly of West Malling.  
 MAYBURY.—On Dec. 10th, at his residence, Cedar Lodge, Frimley, Surrey, William Augustus Maybury, Surgeon, aged 83.  
 MUNCKTON.—On Dec. 12th, at Curry River, near Taunton, William Webber Munckton, M.R.C.S. (for forty-one years coroner for the Western Division of Somersetshire), in the 75th year of his age.  
 RICHMOND.—On Dec. 8th, at his residence, Greenock, Archibald F. Richmond, M.D. Aberd., L.F.P.S. Glas., aged 71.

N.B.—A fee of 6s. is charged for the insertion of Notices of Births, Marriages and Deaths.

# Medical Diary for the ensuing Week.

## Monday, December 19.

**KING'S COLLEGE HOSPITAL.**—Operations, 2 P.M.; Fridays and Saturdays, at the same hour.  
**ST. BARTHOLOMEW'S HOSPITAL.**—Operations, 1.30 P.M.; and on Tuesday, Wednesday, Friday, and Saturday at the same hour.  
**ROYAL LONDON OPHTHALMIC HOSPITAL, MOORFIELDS.**—Operations, daily at 10 A.M.  
**ROYAL WESTMINSTER OPHTHALMIC HOSPITAL.**—Operations, 1.30 P.M.; and each day at the same hour.  
**CHELSEA HOSPITAL FOR WOMEN.**—Operations, 2 P.M.; Thursday, 2.  
**HOSPITAL FOR WOMEN, SOHO-SQUARE.**—Operations, 2 P.M.; and on Thursday at the same hour.  
**METROPOLITAN FREE HOSPITAL.**—Operations, 2 P.M.  
**ROYAL ORTHOPÆDIC HOSPITAL.**—Operations, 2 P.M.  
**CENTRAL LONDON OPHTHALMIC HOSPITAL.**—Operations, 2 P.M., and each day in the week at the same hour.  
**UNIVERSITY COLLEGE HOSPITAL.**—Ear and Throat Department, 9 A.M.; Thursday, 9 A.M. Eye Department, 2.

## Tuesday, December 20.

**GUY'S HOSPITAL.**—Operations, 1.30 P.M., and on Friday at the same hour. Ophthalmic Operations on Monday at 1.30 and Thursday at 2 P.M.  
**ST. THOMAS'S HOSPITAL.**—Ophthalmic Operations, 4 P.M.; Friday, 2 P.M.  
**ST. MARK'S HOSPITAL.**—Operations, 2 P.M.  
**CANCER HOSPITAL, BROMPTON.**—Operations, 2 P.M.; Saturday, 2 P.M.  
**WESTMINSTER HOSPITAL.**—Operations, 2 P.M.  
**WEST LONDON HOSPITAL.**—Operations, 2.30 P.M.  
**UNIVERSITY COLLEGE HOSPITAL.**—Skin Department, 1.45; Saturday, 9.15.  
**ST. MARY'S HOSPITAL.**—Operations, 1.30 P.M. Consultations, Monday, 2.30 P.M. Skin Department, Monday and Thursday, 9.30 A.M. Throat Department, Tuesdays and Fridays, 1.30 P.M. Electrotherapeutics, same day, 2 P.M.  
**PATHOLOGICAL SOCIETY OF LONDON.**—Mr. Wainwright (introduced by Mr. Shattock): Disease of the Adrenals in an Infant.—Mr. W. Arbuthnot Lane: Case of rapidly destructive Papilloma of the Penis. Dr. H. D. Rolleston: (1) (for Mr. Bull) Sarcoma of the Kidney growing down the Ureter; (2) Spontaneous Rupture of Internal and Middle Coats of Aorta leaking into Pericardium.—Mr. J. Jackson Clarke: Case of Squamous Epithelioma of the Septum Nasi due to Psoroparmerosis.—Dr. S. W. Wheaton: A Specimen of Ulceration of the Arm following Vaccination in a case of Hereditary Syphilis.—Dr. F. C. Turner: Sarcoma of both Ovaries in a Child. Card Specimen.—Ivory Exostosis of the Skull.

## Wednesday, December 21.

**NATIONAL ORTHOPÆDIC HOSPITAL.**—Operations, 10 A.M.  
**MIDDLESEX HOSPITAL.**—Operations, 1.30 P.M.; Saturdays, 2 P.M. Obstetrical Operations, Thursdays, 2 P.M.  
**CHARING-CROSS HOSPITAL.**—Operations, 3 P.M., and on Thursday and Friday at the same hour.  
**ST. THOMAS'S HOSPITAL.**—Operations, 1.30 P.M.; Saturday, same hour.

## Notes, Short Comments & Answers to Correspondents.

*It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.*

*Lectures, original articles, and reports should be written on one side only of the paper.*

*Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.*

*We cannot prescribe or recommend practitioners.*

*Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."*

*Letters relating to the publication, sale and advertising departments of THE LANCET to be addressed "To the Publisher."*

*We cannot undertake to return MSS. not used.*

COMMUNICATIONS relating to the EDITORIAL business of THE LANCET must in every case be addressed exclusively "To the Editors," and not to them otherwise than in their official capacity.

### THE NOTIFICATION OF CHICKEN-POX.

MR. JOHN M. FOX, medical officer of health for the Mid-Cheshire Combined Sanitary District, has addressed a note to the Secretary of the Local Government Board, in which he advises that chicken-pox be included within the scope of the Notification Act. He assigns as his reason for taking this step the varied and perplexing appearances assumed by small-pox in vaccinated persons, the consequent increasing difficulty of diagnosis and the possibility, occasionally converted into actual fact, that some such cases will escape detection altogether and be suffered to spread disease among the community. The proposed extension of the Act would cover all doubtful cases and enlist the aid of medical officers of health in determining their true character.

Dr. David Wallace (Edinburgh).—We shall be glad to consider the communication if our correspondent will be good enough to submit it to us.

Mr. T. W. Collinson, M.B., C.M. Edin., M.R.C.S. Eng., is thanked for the suggestion which shall have our careful consideration.

### VESALIUS THE ANATOMIST.

To the Editors of THE LANCET.

SIRS,—Can any of your readers tell me where I may be able to get information as to the private and personal history of Andrew Vesalius. I would like to know whether the great anatomist had ever married, and if so whether he had any children and whether he was fortunate or otherwise in his choice of a wife. I am, Sirs, yours truly,  
 Edinburgh, Dec. 10th, 1892.  
 G. M. C.

Inkerman.—We are much obliged for our correspondent's courteous note; but we think that under the circumstances it would be very difficult to comply with his request.

Raglan should consult his medical attendant.

## WATCHMAKERS AS OCULISTS.

THE treatment of defective eyesight has been hitherto almost completely confined to the attention of two classes: on the one hand stands the skill of the scientific specialist, and on the other the self-confident, though somewhat haphazard, enterprise of the advertising optician. It appears that still another class is to be added, recruited from the humbler ranks of the watchmakers and jewellers. In the current number of the *Horological Journal* is an invitation to the latter to add the special knowledge of treating errors of refraction to their more mechanical craft:—"Messrs. J. Raphael and Co., 13, Oxford-street, W., request us to state that they are preparing a room for the purpose of giving instruction to watchmakers and jewellers in defects of vision and the art of applying suitable glasses applicable to various cases. Dr. Percy Jones, of the Westminster Ophthalmic Hospital, and Mr. C. Wilkinson, late attendant at the Eye Hospital, Moorfields, will be in attendance. Considering the large number of watchmakers and jewellers that are called upon to provide relief for customers suffering from astigmatism and other abnormal eccentricities, the facilities proposed by Messrs. J. Raphael and Co. will doubtless be widely appreciated." As the above announcement appeared in the editorial columns of a trade journal it is to be hoped that it was inserted without the knowledge of either of the gentlemen concerned, and it would be unfair to make further comment without affording them some opportunity of explanation.

*Dr. J. McKenzie Davidson.*—Engenolactamide does not seem to be obtainable from wholesale chemists in London. For local anaesthesia the crystals may be applied direct to the mucous membrane. Further information about this substance may be obtained from the original paper in the *Pharmaceut. Centralb.* No. 30.

*Dr. Jas. A. Rigby (Preston).*—The communication shall receive attention.

## "NEW SOURCE OF LEAD POISONING."

To the Editors of THE LANCET.

SIRS,—Electric storage batteries are stated in your last issue (p. 1302) to be recently discovered to cause lead poisoning during their manufacture. A reference to THE LANCET, January, 1883, p. 161, will show that you have very fully described this source of plumbism (in the *Medical Digest*, Section 288:5, for "L. 1/83, p. 161" read p. 161).

I am, Sirs, yours faithfully,

Boundary-road, N.W., Dec. 12th, 1892. RICHD. NEALE, M.D. Lond.

## PRICE OF MEDICINES.

THE Danish Pharmaceutical Union has at various times caused prescriptions to be made up in the best pharmacies of different countries, in order to compare the prices charged with those obtained in Denmark. In 1888 a prescription for which the price in Denmark was represented 100 was charged in Norway 110, in Austria 117, in Belgium 141, in Germany 145, in Switzerland 149, in Russia 197, in Italy 242, in France 247, in England 259 and in the United States 350. During the present year different parts of the German empire were tested, and it was found that Saxony and Prussia were perceptibly cheaper than Wurtemberg and Alsace-Lorraine. The most expensive of the large cities of America which were tested proved to be New York, where a prescription costing a franc in Denmark cost 4 fr. 40.

*West Africa.*—We cannot fix a date for the publication of the Report of the Commission which we have appointed to investigate the subject of Malarial Fever. Approximately we might mention the months of April or March next.

*Mr. D. S. Kemp.*—The original paper regarding the effect of bitters will be found in *Les Nouveaux Remèdes*.

## THE METHOD OF FIXING BLOOD FILMS.

*Seloc* might consult another paper by Dr. Muir, which appeared in the October number of the *Journal of Pathology and Bacteriology*; also the coming number of the Proceedings of the Royal Society, as Messrs. Kanthack and Hardy have quite recently given a paper on Eosinophilic Cells, in which they discuss the various methods of preparation; and Harris and Power's "Manual for the Physiological Laboratory," 5th Edition, page 77

## THE PIANOFORTE AS A FOCUS OF INFECTION.

THE sources of infection in this civilised age are as numerous as they are varied and meet us at every turn. The *Musical Times* in one of its recent issues calls attention to one of these sources of trouble, and one which is very apt to be overlooked. A well-to-do household is extremely likely to include amongst its members a devotee of one of the "tuneful nine." The probable presence of musical instruments in such a family cannot be regarded as a very violent assumption, and in the list of such distributors of harmony the pianoforte will very likely take a prominent place. Yet the result of the fondness for sweet sounds may perchance be the introduction into the home of an element of discord much more displeasing than that which strikes the sensitive ear, since it may affect the harmonious working of the whole economy. How this disaster may arise is set forth with more or less cogency by our contemporary aforesaid. He puts the matter in this way. A garment exposed to infection can, he says, "be quickly disinfected, but it is far more difficult to fumigate all the multitudinous cloths, baizes, felts, and woollen materials which the complex mechanism of a piano contains. It is questionable, indeed, whether this is ever properly done. Few pianos are regularly cleaned out. Dust accumulates in them, and they become a receptacle for all kinds of dangerous germs. Amongst musicians it is well known that one of the chief centres in Germany of cheap piano-making is Hamburg; and—especially in the alum of St. Pauli, where the cholera has been rife—thousands of pianos are in course of construction, the majority of which are destined for the English market." Without wishing to lay undue stress on the importance of attention to this danger in the household, it is well that the recognised principles of cleanliness should be observed in respect of such articles of furniture as commonly escape thorough inspection, in consequence of the difficulty and expense attending the process.

*Mr. E. K. Knox.*—An English medical man wishing to practise in the Canary Isles should obtain the *Licenciado* from the Central University, Madrid, or from some other Spanish Medical Faculty for which he may be required to pass an examination, and he must be prepared for possible delay and disappointment. The best course would be to communicate in the first place with the British Consuls at Madrid, Tenerife and Cadiz.

*Perplexed* asks: "Will any medical brother kindly give me advice how to recover a debt for professional attendance upon a staff sergeant in the army and a stoker in the navy? I am told that they cannot be sued as civilians."

*Mr. R. Gordon.*—We do not insert advertisements from medical aid associations in want of medical officers.

*Mr. H. S. Page and Mr. Geo. N. Patterson.*—We do not recommend practitioners.

*Avunculus* has not enclosed his card.

ERRATUM.—We are requested to state that in the marriage announcement "Smart—Caddy," published in our issue of Dec. 10th, the gentleman's name should have read "William Herbert Smart, M.A., M.B. (Cantab.)," not "M.D." as printed.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

During the week marked copies of the following newspapers have been received:—*Redcar and Saltburn-by-the-Sea Gazette, Health, Leicester Daily Post, Agnostic Journal, Sheffield and Rotherham Independent, Hospital Gazette, Woman, Western Gazette, Morning Leader, Daily Chronicle, The Zoophilist, Tasmanian Mail, Public Opinion, Norfolk Daily Standard, Star, Harwich Free Press, Sitings, Le Courrier de la Presse (Paris), Insurance Record, City Press, Surrey Advertiser, Leeds Mercury, Bristol Mercury, Yorkshire Post, Liverpool Daily Post, Reading Mercury, Local Government Chronicle, Weekly Free Press and Aberdeen Herald, Local Government Journal, Mining Journal, Hertfordshire Mercury, Blackpool Times, Hampshire Advertiser, Aberystwith Observer, Bognor Observer, West Sussex Gazette, Bath Chronicle, Le Temps (Paris), Manchester Guardian, Pioneer Mail Times of India, Sunday Times, Hull News, Vegetarian, North British Daily Mail, Builder, Architect, Evening Chronicle (Newcastle).*

**SUBSCRIPTION.**

POST FREE TO ANY PART OF THE UNITED KINGDOM.

One Year ..... £1 12 6 | Six Months ..... £0 16 3

TO THE CONTINENT, COLONIES, UNITED STATES, INDIA, CHINA, AND ALL PLACES

ABROAD ..... One Year 1 14 8

\* \* In consequence of the new postal arrangements, the Annual Subscription for India, China, and all foreign countries will now be reduced to £1 14s. 8d., instead of £1 16s. 10d. as formerly.

Post Office Orders and Cheques should be addressed to The Publisher, THE LANCET Office, 423, Strand, London, and crossed "London and Westminster Bank, St. James's-square."

An original and novel feature of "THE LANCET General Advertiser" is a special Index to Advertisements on pages 2 and 4, which not only affords a ready means of finding any notice, but is in itself an additional advertisement. Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance. Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET. Terms for Serial Insertions may be obtained of the Publisher, to whom all letters relating to Advertisements or Subscriptions should be addressed.

THE LANCET can be obtained at all Messrs. W. H. Smith and Son's Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Agent for the Advertisement Department in France—J. ASTIER, 66, Rue Caumartin, Paris.

A Clinical Lecture

ON THE

VALUE OF SUTURES IN THE TREATMENT OF CUT THROAT AND SURGICAL WOUNDS OF THE AIR PASSAGE.

Delivered at the Middlesex Hospital on Nov. 29th 1892,

By HENRY MORRIS, M.A., M.B. LOND.,  
SURGEON TO AND LECTURER ON SURGERY AT THE HOSPITAL.

GENTLEMEN,—I have recently described to you the varieties of wounds met with in cases of cut throat and also the sources of danger and the after complications in these cases. In my lecture yesterday I pointed out the effects of a foreign body in the air passages and the treatment you should employ in such accidents, and I told you that as there is danger so long as such a body remains in the air passages it is the surgeon's duty to remove or aid the expulsion of it by early tracheotomy, laryngotomy or thyrotomy.

Now, at first sight it may seem to you that there is no connexion between the treatment for cut throat and for foreign bodies in the windpipe; but there is this in common, that in each class of cases you may have to decide the question as to the employment of sutures. It is on this subject I wish to speak to you to-day, basing my remarks on cases which have been under my care in the hospital.

If you will refer to a passage in that very excellent and standard article on "Wounds of the Neck" by Mr. A. E. Durham in the third edition of the "System of Surgery" you will find, under the account there given of the treatment of cut throat, directions of which the following is an abstract. Mr. Durham says that as a general rule neither sutures nor adhesive plasters should be used, and for these reasons: 1. They are at best needless in most cases, because primary union can rarely be expected. 2. They are sources of danger in various ways: (a) If bleeding recurs blood may trickle into the air passage and cause suffocation; (b) at a later period purulent discharges may pass into the air passages or otherwise give rise to serious trouble; (c) inflammation and œdema of the neighbouring parts and of the mucus membrane of the larynx may ensue, or viscid mucus may collect, and if it cannot be expelled through the wound will obstruct the air passage and increase dyspnoea; (d) closure of the external wound by sutures is liable to be followed by emphysema. It is allowed that in the healthily granulating stage the surfaces may be approximated by sutures and plaster, though they may be torn out during coughing, and must be removed if discharges are confined, or pain is occasioned. Nelaton, we are told, recommended sutures at this stage in order to prevent the turning in of the edges, and the risk of a permanent fistula. It is also allowed that in certain exceptional cases sutures may be necessary from the first, as where "the cartilages of the larynx are cut in several places and the different pieces are much separated from each other"; and in cases "where complete division has been effected between the thyroid and cricoid cartilages, and these parts are separated from each other, one or two sutures may be used to approximate them; and if the trachea is completely divided across it may be desirable to have recourse to one or more sutures"; but, Mr. Durham adds, "in all such cases it is better to wait for a time after the divided portions of the air tube have been sutured in order to judge of the effect produced before attempting to close the external wound." No directions you see are given for the immediate and complete closure of the wound by a number of sutures introduced into each of the divided structures.

Mr. Durham in this description lucidly sets forth the treatment in common practice with surgeons, and recommended in standard works on surgery. Nor did it escape his researches into the literature of his subject that Albanese of Palermo, "whose experience in the treatment of wounds has been very extensive, would appear to advocate the immediate application of sutures in all cases of wounds of the trachea." In describing the removal of foreign bodies from the larynx by thyrotomy Mr. Durham says: "After the foreign body has been extracted, the edges of the incision through the

thyroid cartilage should be brought together and secured by sutures not passed through the mucous membrane. It may be well to retain the laryngeal or tracheal cannula for two or three days, or until all indications of laryngeal mischief have passed away."

As many of you know, I have ventured to depart from the usually approved practice of leaving cut throat wounds to heal by granulation and cicatrization, and have sought by the liberal employment of buried and superficial aseptic sutures to bring about immediate union. In doing this I use great care, after thoroughly cleansing all the parts about the wound, to unite accurately end to end the cut edges of each structure which has been divided; cartilage with cartilage, membrane with membrane, muscle with muscle, fascia with fascia and skin with skin; by this means, and at the same time by the insertion of a few pieces of drainage-tube at selected points of the wound, the various, sources of danger which have been mentioned above are provided against and primary union has been readily attained.

I first used sutures on the air passage in January, 1888, in a case of papilloma of the larynx removed by extra-laryngeal excision. The crico-thyroid membrane, the cricoid cartilage and the membrane between the cricoid cartilage and first ring of the trachea were incised vertically and afterwards the wound was completely and accurately closed by five carbolised catgut sutures passed so as not to perforate the mucous membrane. Two were inserted in the crico-thyroid membrane, two in the cricoid cartilage, and one in the membrane below the cartilage; and two silk sutures held the skin together. Immediate union was obtained.

After vertical section of the cricoid cartilage it would seem that sutures prevent lateral gaping, otherwise caused by the inferior constrictor muscles. This was indicated by the sense of dragging and pulling experienced by the patient during swallowing, and referred by him to the cricoid cartilage. When publishing this case I recommended the treatment by primary sutures in cases of cut throat with the view to obtain immediate union and thereby avoid the possible contraction of the cicatrix which follows healing by granulation. Immediate union is not followed by contraction, and if the edges of the divided air tube be accurately sutured emphysema will not occur and there will be no danger from the entrance of discharges from the surrounding tissues into the lungs. Allowing for the defective state of the health and the depressed or excited mental condition of most persons with cut throat, the wounds being of the incised character ought, if accurately approximated and aseptically maintained, to heal by immediate union.

At the time I wrote the only case of cut throat in which I had applied sutures neither the food passage nor the air tube had been opened. It was not long, however, before I had the opportunity of putting my recommendation into practice, and I have on three occasions since employed primary sutures where the air passage has been opened. I will now briefly relate these cases in the chronological order in which they occurred.

CASE 1.—On August 1st, 1888, a man aged forty-five was admitted into Broderip ward. He was a well-made man, with a very restless manner, an anxious expression, pallid mucous membranes and a cold clammy skin. He had been drinking freely for ten days and on two occasions had had delirium tremens. On the front of his neck were two clean cut wounds self-inflicted with a razor two hours before admission. The upper wound was situated just in front of the hyoid bone, and extended one inch and a half to the left and one inch to the right of the mesial line, dividing the soft structures down to the bone. The lower, almost horizontal, extended about two inches on each side of the middle line. The skin, fascia, muscles, thyro-hyoid membrane and epiglottis were completely divided, and when the head was slightly raised the rima glottidis and back of the pharynx were brought into view. The two wounds were separated by a narrow strip of skin about half an inch wide. Hæmorrhage had been arrested before admission. The tongue was pale, moist, furred and tremulous. Pulse 68, small and compressible. Respiration 20, regular and unattended by pain. Phonation was neither painful nor defective. Shortly after admission he was removed to the operating theatre, anaesthesia was induced, and a thorough examination of the wounds was made, in the course of which there was rather free hæmorrhage from unsecured branches of the superior thyroid artery. These were ligatured,

and after removing blood-clots and thoroughly cleansing the wounded parts the upper wound was closed with several fine silk sutures. The lower wound was then attended to, and first the cut edges of the epiglottis were accurately held together by four (non-chromicised) aseptic catgut sutures. These were inserted obliquely and so that the mucous membrane was not injured, and when tightened good apposition all along the cut edges was obtained. The edges of the divided thyro-hyoid membrane, then the divided sterno-hyoid and thyro-hyoid muscles were in turn sutured with catgut, and the skin wound was closed with fine silk sutures. A small drainage-tube was inserted at each extremity of the wound, and dry boracic dressing was applied. The head was bent forwards and fixed in the usual way, just as if the wound had not been closed by sutures. An enema of beef-tea and brandy with a little liquid extract of ergot was administered on his return to bed, but was not retained, and he was found to have diarrhoea. A few hours afterwards—viz., at 5 P.M.—he had not been sick, but had spat up a few small blood-clots; there was slight difficulty in breathing. As the diarrhoea was troublesome a starch and opium enema was administered. At 9 P.M. he was quite comfortable, there was scarcely any dyspnoea, and the diarrhoea had abated. On Aug. 2nd there was neither pain, cough nor dyspnoea, but the patient was very restless and had only slept one hour. The temperature and pulse were regular. Nothing had been given by the mouth, and the nutrient enemata had been only partially retained. In the afternoon of this day the wound was dressed; it was looking quite quiet; a little blood-stained serum had escaped. In the morning of Aug. 3rd everything was perfectly satisfactory. The drainage-tubes were discontinued. Some water was given him by the mouth, none of which escaped at the wound. At 9 P.M. on this, the second, day fifteen ounces of milk and two ounces of whisky were swallowed slowly, but without pain or difficulty, and three or four small pieces of ice were taken just afterwards. From this time he improved rapidly and continued to be fed by the mouth on milk-and-whisky, a pint of milk and two ounces of whisky night and morning. On Aug. 7th all the superficial sutures were removed. There were a few drops of laudable pus from the track of the right drainage-tube. The wound being quite healed on the 10th, he was allowed up on the following day. He walked into the garden for an hour. He expressed himself as quite well, without pain or tenderness or difficulty of breathing or swallowing or any defect of voice. On Aug. 14th a laryngoscopic examination showed the larynx congested, the epiglottis curved so that its external margins unduly approximated towards the glottis. The vocal cords were normal in appearance and action. He left the hospital at the end of the fortnight from the infliction of the wound.

CASE 2.—A man aged fifty-four cut his throat in three places with a large clasp knife about 8.30 A.M. on Dec. 12th, 1889. He was seen soon afterwards by the late Mr. Bellamy, and some carbolised lint and a bandage having been applied to the wounds he was brought to the Middlesex Hospital and admitted under my care. He was in a very restless and violent state and tried to tear off his bandages; he stared wildly around him, and his hands and legs had to be strapped down to keep him at all quiet. Every three or four minutes there were convulsive spasms of various muscles, the muscles of the face and arms being specially affected. At one time there was opisthotonos, but this was thought by the house surgeon to be caused by voluntary struggling. The patient was quite conscious. A large quantity of blood was said to have been lost. He had been an epileptic for six or seven years and latterly his mind had been giving way. His relatives had contemplated sending him to a lunatic asylum. Five years ago he contracted syphilis, through a chancre on his finger (he was a medical practitioner), when attending a midwifery case. He had been for some time somewhat intemperate. An hour or two after his admission he was taken to the operating theatre, anaesthetised, the wound cleared of clots, all bleeding points were torsioned or ligatured and all the divided parts brought together and maintained in accurate apposition by sutures;—buried catgut sutures being used for the laryngeal structures, muscles and fascia; and silk sutures for the skin;—three drainage-tubes were inserted, the wound was dressed with dry antiseptic dressing and the patient was returned to bed, where his head was fixed in the approved fashion. Restlessness and excitement returned after recovery from the anaesthetic and he expressed his determination not to get well. The next day the wound was doing quite satisfactorily, but his restlessness and excitement continued. He made frequent efforts to tear open

the wound, and during the second night after the operation—about 1 A.M. on Dec. 14th—he suddenly raised himself and, violently bending his body forwards, tore open his wound and then sank back in bed exhausted and died in a few seconds. The post-mortem examination was made thirteen hours after death, and the following notes are extracted from Mr. Leopold Hudson's report:—A well-nourished, well-built man. (a) Deep incised wound three inches and a half in length notching the thyroid cartilage just below the pomum Adami. The greater part of this incision was on the left of the middle line. (b) A second incision was on the left of the first and above it, and it ran downwards and inwards towards the middle line, joining the first obliquely. (c) A third incision, three inches long, began at the middle line and ran horizontally outwards to the right on the level of the thyro-hyoid membrane. There was considerable effusion of blood into the posterior wall of the pharynx and a perforating wound of the pharynx just behind the left superior cornu of the thyroid cartilage. The tip of the thyroid cartilage itself had been shaved off. There was marked oedema of the left aryteno-epiglottidean fold and to a less degree of the right also. There was a jagged wound in the larynx beginning above the left false cord posteriorly, and running upwards and forwards to terminate in the substance of the epiglottis. The epiglottis had been partly divided. There was extensive extravasation beneath the mucous membrane around this cut. The stitches which had been placed in the deeper parts could be seen; none of them had penetrated the mucous membrane. The upper lobe of the left lung was partially adherent. The lower lobe of each lung showed some small areas of inhaled blood, and there were some patches of lobular pneumonia in the lower and back part of each lobe. The upper lobes were emphysematous. The right side of the heart was distended with fluid blood. The left ventricle was very considerably hypertrophied. The aorta showed patches of atheroma. The liver contained a small branched calculus in the substance of its right lobe, but otherwise was normal. The kidneys had very adherent and thickened capsules and the cortex of each was indurated and in places atrophied. The stomach contained a small quantity of altered blood; its mucous membrane was somewhat injected.

CASE 3.—A man aged forty was admitted into Broderip ward on March 8th, 1890, having cut his throat, dividing muscles, fascia and thyro-hyoid membrane, but not the epiglottis. Bleeding points were ligatured and under chloroform the divided structures were brought together separately by buried catgut sutures; silk sutures being used for the skin. Three drainage-tubes were introduced. Boric lint and boric charpie covered with alembroth gauze were the dressings. The wound healed without an interruption and the man was discharged from the hospital on March 27th.

CASE 4.—A man aged forty-eight was admitted into Broderip ward at the end of October, 1891, suffering from a urethral stricture for which perineal section had to be performed. As he was approaching convalescence he became morose and depressed, dreading his discharge from the hospital and being under some delusions about the stoppage of his pension, and pauperism that was staring him in the face. His discharge from the hospital was postponed once or twice because of this, but it was not suspected that he meditated suicide. However, on Jan. 20th, 1892, at 5 A.M., the man dressed himself and went to the lavatory. The nurse, who was attending to a patient close by, saw him go in and shut the door, and shortly afterwards, hearing strange gurgling sounds and thinking he was vomiting, she went to the lavatory and there found him on his hands and knees bleeding profusely from a deep wound in the throat and a blood-stained razor lying on the floor beside him. She promptly placed a draw sheet round the wound, endeavoured to stanch the hæmorrhage by pressure and sent for the house surgeon. On his arrival digital compression and afterwards torsi-pressure forceps and ligatures arrested the bleeding. The wound extended from one sterno-mastoid to the other. Two gashes had been made, bisecting one another in the middle line just at the apex of the thyroid cartilage. The skin, fascia, platysma, thyro-hyoid and sterno-hyoid muscles on each side, the thyro-hyoid membrane and the epiglottis on the level of the upper border of the thyroid were all divided. On the right side the wound was more extensive than on the left and the anterior edge of the sterno-mastoid was cut, the carotid sheath was exposed and many small, but none of the main, arteries were divided. On the left side two or three small arteries were divided. Between 1 and 2 o'clock the patient was removed to the operating theatre,

anæsthetised, every bleeding point was sought for and secured by ligatures, and after thoroughly clearing the wound seven catgut sutures were required to unite the epiglottis and the thyro-hyoid membrane. Thirteen catgut sutures were inserted into the muscles and fasciæ; and the cut edges of the skin were joined by sixteen fine silk sutures. Three small drainage-tubes were introduced, one in the centre and one at either end of the superficial part of the wound. Dry iodoform dressing was applied and the patient's head was fixed in the usual way. Nothing was to be given by the mouth for twenty-four hours, but he was to be fed by nutrient enemata, consisting of beef-tea and half an ounce of brandy every four hours. During the evening and night the patient was sick twice and the vomit contained a little blood-stained mucus. On the 22nd and 23rd the temperature rose to 101°, but the wound was doing perfectly well. The drainage-tubes were removed and shortened on the 22nd, and altogether discontinued on the 26th. He was allowed to take fluid nourishment by the mouth on the 23rd. There was only slight difficulty in swallowing. He had previously had a good deal of cough and expectorated a quantity of greenish sputum. On the 24th he sweated a great deal, was in a highly nervous state, very morose and restless, and had a very wild appearance; but his pulse was fair, his temperature 98°, and the wound was doing thoroughly well, the edges having united by first intention except where the drainage-tubes were. He declared he could not swallow and efforts at swallowing seemed to cause some straining; but the dysphagia was largely feigned, though in part it was real and probably due to stiffness and soreness at the base of the epiglottis, when the tongue was moved in deglutition. Certainly it was not excited by convulsive coughing set up by the passage of the food over the epiglottis and upper aperture of the larynx as is so often the case when the wounded parts are left ununited by sutures. On Jan. 29th all the superficial sutures were removed. The scar was firm and narrow; dysphagia had ceased entirely. There was no expectoration. He got up to-day and every day from this time. On Feb. 5th he went into the garden and on the 15th he left the hospital. He might have left sooner, but was detained for some days longer than necessary because of his repugnance to leave. On Feb. 29th it was reported to some of the ward staff that he had endeavoured, but without success, to reopen his throat by dragging forcibly at the scar.

The quick recoveries in Cases 1, 3 and 4 speak for themselves. The patients may be said to have quite recovered within ten days of the infliction of the wounds. In Case 2 there is no reason to doubt that the same excellent result might have been attained had the patient only allowed himself a chance by keeping quiet and being amenable to treatment.

Besides the brief paragraph in Albanese's article on "Wounds produced by Weapons,"<sup>2</sup> where he makes allusion to his success in the treatment of wounds of the trachea by interrupted sutures and antiseptics, the following letter shows that the same line of treatment had suggested itself to Surgeon-Major J. S. Abye Curran, who wrote to me in 1888 as follows:—

"Lissonfield, Rathmines-road, Dublin, May 2nd, 1888.  
 "DEAR SIR.—With reference to the concluding paragraph of your very interesting paper which appeared in the *British Medical Journal* of April 21st, I have great pleasure in stating that I entirely agree with you in the conclusions you have arrived at as regards the best treatment in cut throat. I have had some five or six cases under my care amongst the troops in India, all of whom, I am glad to say, eventually recovered, but the mode of treatment never satisfied me as being correct or surgical. My last case there was a bad one: the wound was inflicted by a razor and extended horizontally across the throat for about three inches and a half, completely cutting across the thyro-hyoid membrane and allowing the larynx and trachea by its own weight to fall down, leaving a gap of about one inch between the cut ends. The hæmorrhage was great, although none of the large vessels were cut. The epiglottis remained attached to the upper segment; all fluid taken by the mouth returned by the wound. He was fed by daily passing a stomach tube. I applied a gymnastic belt round his waist, and had his head fastened down to this by long tapes attached to a night-cap. I tried by every means in my power to keep the parts in apposition, but failed, and in desperation put in two silver wire sutures, one on either side through the ala of the thyroid and round the hyoid. One cut its way through the thyroid next day from the constant coughing, and I put strong silk ones instead, which acted better. I then brought the wound together except at the very centre, and things went on well for a few days when œdem of the plicæ setting in I had to perform tracheotomy. The case ultimately made an excellent recovery, but the

entire case so disgusted me that I resolved the next case I should have to treat of a similar nature I would perform tracheotomy on the spot and bring the edges of the wound together. Having returned soon afterwards from India I had not an opportunity of carrying out my wishes, and had forgotten all about the matter until seeing your paper.

"I am yours very sincerely,

"J. S. ADYE CURRAN, M.B., F.R.C.S.I.,  
 "Surgeon-Major, M.S."

This account by Surgeon-Major Curran gives an excellent picture of the miseries and delay which attend healing in cases not treated by accurate closure of the wound by primary buried sutures. It will be noticed that Dr. Curran's patient had cut into his air passage on the same level as each of my patients—namely, through the thyro-hyoid membrane—detaching part of the epiglottis.

The frequency of cases of cut throat in civil practice may be guessed at from the following particulars extracted from the records of the hospital for the purposes of this lecture by Mr. Leopold Hudson:—

Year.	Cases.	Sex.	Result.
1887	4	3 males and 1 female	All recovered
1888	4	All males	2 died
1889	5	All males	1 died
1890	1	A male	Recovered
1891	3	All males	1 died
1892	6	5 males and 1 female	All recovered

Two of the cases of 1888 were under my care; in one the air passage was not opened, the other is Case 1 related above; in both sutures were used and both recovered. The fatal case in 1889 is Case 2 related above. Of the 10 cases in 1890, 1891 and 1892, in 4 there were wounds of the air passage; one through the thyro-hyoid membrane dividing the epiglottis, one through the crico-thyroid membrane, and one through the trachea wounding the œsophagus. In a fourth (Case 3, *supra*) the thyro-hyoid membrane was cut without the epiglottis being divided. In one of these 4 cases there were two wounds, in the other 3 the wounds were single. Of the 6 cases in which the air passage was uninjured the wounds were single in 3 cases, double in 2, and triple in 1. In one of these 6 cases the left sterno-mastoid muscle was cut halfway through; the wounds in the other 5 cases were quite superficial. In all 6 cases sutures were used, and 3 of them suppurated.

On this last mentioned fact I wish to say a few words. One of the 3 cases which suppurated was under me, and it forcibly shows the advantage of the primary introduction of sutures at as early a stage as possible, and also the necessity of restraining the movements of the head and neck during treatment.

A man aged forty was admitted on Oct. 8th last with a cut nine inches long from a spot one inch below the left mastoid process to a corresponding point on the right side. The left sterno-mastoid was cut half through. No large vessel was divided. Three sutures only were inserted and these at long intervals apart. The wound was covered with a piece of lint and a thick layer of cotton wool retained by a bandage. No head and waist straps were applied. As the wound did not extend into the air tube, and as no important structure had been wounded, and as I was told sutures had been inserted, I did not look to the wound till the 10th, when I at once ordered several other sutures to be introduced. On the 12th delirium tremens was well established, the wound had suppurated and the stitches introduced on the 10th all gave way. The only sutures which held were the three inserted immediately after his admission into hospital. At each of these spots primary union took place, and did not afterwards break down in spite of the restlessness during delirium. I think it fair to conclude that had a number of sutures been introduced at once and the head fixed with two bands passing from the head to the chest or waist belt the whole wound would have healed securely by primary union. Be this as it may, however, I would impress upon you the necessity of securely fixing the head and steadying the neck during the healing of the wounds after closure by sutures.

The advantages to be obtained in cases of cut throat from the use of primary sutures in the manner I have recommended may be summed up as follows:—1. The cut edges of each structure being brought into exact apposition, and so retained by the sutures, union by first intention is secured. 2. This rapidity of union allows of rectal feeding being employed up to the time the patient can swallow naturally. 3. The distress caused by feeding three or four times a day through a tube passed into the pharynx or œsophagus is thereby avoided. 4. The prevention of painful or distressful attempts at swallowing, attended by the escape of the fluid at the wound and the excitement of troublesome spasmodic cough. 5. The pre-

<sup>2</sup> Albanese's statement is: "Les blessures même à la trachée, le plus souvent transversales sous la région hyoïdienne, provenant d'homicide ou de suicide, furent aussi toujours réunies par provoir intention par des points de suture détachés, et je confesse n'avoir jamais vu survenir la moindre suffocation." Extract from article in the *Transactions of the International Medical Congress, 1881*, vol. ii., p. 436, *Blessures à l'Arme Blanche*, by Dr. E. Albanese, Palermo.

vention of the great risk of contraction or stricture of the air passage or food passage so likely to follow when the wounds have been allowed to heal by granulation. 6. The prevention of a temporary, or permanent fistula opening into the air or food passage. 7. The avoidance of an alleged danger in cases where the epiglottis is cut through—viz., of suffocation from the detached portion of the epiglottis falling over the upper aperture of the larynx.

I have called this last an alleged danger because I am very sceptical about it being a real one, except in those very severe cases when the wound is above the hyoid bone and, extending right through the base of the tongue, shaves off the tip of the epiglottis. In such cases the tip of the cartilage, cut right adrift as it may be, is certainly capable of falling over the aperture of the larynx, but in all probability it will be in a moment blown away by a forced expiratory effort. Of course there is the possibility of a piece small enough being chopped off to fall into the cavity of the larynx, and if not coughed out at once causing suffocation. But there is no danger from this cause when the wound is on the level of the thyro-hyoid membrane. In these wounds if the epiglottis is cut through it is divided below some or all of its attachments to the glosso-epiglottidean folds; and, held by these, it is drawn forwards, but cannot fall backwards over the laryngeal aperture.

I show you here the tongue and larynx from two post-mortem room subjects, in which the throat was cut after death at this level, and in each case it was found that there was no tendency whatever for the upper part of the epiglottis to fall back. On the contrary, it fell forwards towards the base of the tongue and sank downwards slightly, so that the lower edge of the part still held by the glosso-epiglottidean folds was somewhat in front of the upper edge of the part attached to the thyroid cartilage. In this way a vertical aperture is left between the cut edges through which any liquid taken into the mouth mechanically runs away through the wound.

## A Lecture

ON THE

# MINOR AILMENTS OF THE RECTUM AND ANUS.

*Delivered before the Preston Medico-Ethical Society,*

By J. A. RIGBY, M.D. LOND.

MR. CHAIRMAN AND GENTLEMEN,—The subject I am about to address you upon to-night—Minor Ailments of the Rectum and Anus—is one which is exceedingly difficult to deal with, not because of its obscurity but because of its simplicity. At the outset I mean to refer to the subject of hæmorrhoids, their causation and accompaniments. It is said that hæmorrhoids are frequently caused by obstruction of the circulation, either through heart, lungs or liver; thus the veins of the rectum, it is said, more frequently become hæmorrhoidal in cirrhosis and other diseases of the liver or in thoracic disease. I do not agree with this opinion. I do not think, judging from my own experience, that patients suffering from thoracic disease or cirrhosis, or any other disease of the liver, are one whit more subject to hæmorrhoids than anyone else; and if you think the matter out there is no reason why they should be. Take the case of heart disease, for instance, where there is hypertrophy. The increased muscular action is merely compensatory and is entirely occupied in overcoming the valvular resistance or incompetence, so that there is no actual increase of pressure in the blood stream. The circulation may be, and doubtless is, particularly in the later stages, more sluggish, but there never is, from beginning to the end, any increased intravenous pressure such as would cause hæmorrhoids. Again, in the case of cirrhosis of the liver we get a gradual invasion of and encroachment upon the real glandular tissue of the liver, with more or less complete obliteration of the bloodvessels. This at first sight would appear a most fruitful source of dilatation of the hæmor-

rhoidal veins and consequently of hæmorrhoids; but what says experience? I have attended numerous cases of cirrhosis of the liver, and as far as my memory serves me they were not distinguished by the presence of hæmorrhoids any more than other cases, if so much. The reason of this is obvious. The obliteration of the bloodvessels by the new fibrous growth proceeds very slowly. The portal vein is formed by the junction of the superior mesenteric and splenic veins; the superior mesenteric returns the blood from the small intestines, the cæcum and ascending and transverse portions of the colon; the splenic returns the blood from the substance of the spleen and receives the vasa brevia from the left extremity of the stomach, the left gastro-epiploic vein, pancreatic branches from the pancreas, the pancreatico-duodenal vein and the inferior mesenteric vein. Now I wish you to particularly notice what the inferior mesenteric vein does. It returns the blood from the rectum, sigmoid flexure and descending colon, but it does more—its hæmorrhoidal branches insinuate with those of the internal iliac and thus establish a communication between the portal and general venous system. Now let us see the effect of this most important insinuation on the subject of hæmorrhoids. In cirrhosis of the liver there is a gradual but certain and remorseless strangulation and obliteration of the portal vein and its tributaries, there is constantly increasing distension of the terminal venules of these tributaries with, ultimately, ascites due to the distended vessels relieving themselves one way or another (which it is not my present province to discuss) of their excess of fluid; but, in consequence of the insinuation of the hæmorrhoidal branches of the inferior mesenteric vein with those of the internal iliac, a safety valve action occurs, the pressure is relieved, the excess of blood is sent into the general circulation and we do not get hæmorrhoids in consequence of cirrhosis of the liver. I have taken some pains to go into this thoroughly, because these things are passed on from one text-book to another without in many cases being carefully tested clinically; and hence we are hampered at the outset of our career with wrong theories of causation and consequently our treatment of these maladies is inefficient and exasperating both to ourselves and to our patients. Again, this safety-valve action of the internal iliac on the inferior mesenteric veins explains clearly why constipation, the pressure of tumours and of the gravid uterus are not by any means the great factors in the causation of hæmorrhoids. They are often said to be. Besides the constant presence of hæmorrhoids in persons who are otherwise quite healthy and subject to no other infirmities shows clearly to me that we must find another solution for these troubles.

With your permission I will now give you my theory as to their causation. In the first place, I find them quite as frequently—I believe more frequently—in persons whose bowels act regularly or are even somewhat relaxed than in those who suffer from constipation, which is explained by a careless and unnecessary prolongation of the act of defecation and the consequent incarceration of a portion of rectal mucous membrane within the sphincter ani. The subsequent discomfort, as the day passes on, eventually most likely wears off; the standing posture, movement and the tonicity of the lining of the bowel itself, ultimately remove the prolapsed bit of mucous lining beyond the reach of the sphincter and the patient again feels comfortable. The same process is subsequently repeated, however, till in course of time he finds that every morning for some hours after evacuation he is in a state of more or less pain, often amounting to absolute agony, for as you can readily see it is a mischief that tends to perpetuate itself and increase. The tender lining of the bowel has no time to recover itself before it is attacked again and the irritable sphincter lays hold of the slightly prolapsed lining at once, and by its constant action draws down and bruises or crushes it more and more, till, in cases that have gone on for years, the patient has often no respite, not even for a minute in the day, and presents himself to you a pitiable object with a ring of congested, inflamed or even sphacelated lining of rectum external to the sphincter ani. I could have described the process more in detail than I have done, but I think you will be able to grasp my contention now, which is, that hæmorrhoids are a purely local complaint in the great majority of instances, and that constitutional causes, and liver complaints especially, play a very small part indeed in their production. Another important factor in the production of hæmorrhoids is the customary position for defecation, which imparts too much force into the process.

Now I am going to take you a step further in the train of causation. We have found dilated hæmorrhoidal veins, caused by strangulation by means of the sphincter ani, a bruised, inflammatory and swollen condition of the mucous membrane from the same cause and a prolapse more or less complete of a ring of mucous membrane through the sphincter. This state of affairs is so intolerable that frequently the patient himself observes that it is only to be relieved by gently returning the prolapsed bowel at once through the sphincter after each stool. The day comes, however, when through hurry or carelessness or because the prolapse has been more swollen than usual the patient finds that on returning the gut he does not attain his usual ease, but is left with a weary burning pain which lasts for hours. What has happened? In returning the gut he has made a fissure of the anus, and though on examination you may perceive only what seems an insignificant crack, yet you have there the elements of the most lasting pain and distress, and what, if unrelieved, is sufficient to embitter life. I now come to the treatment. The hackneyed treatment adopted is to relieve the portal circulation by aperients, often mineral waters. The preparations of sulphur, senna and black pepper are greatly in favour and astringent ointments enjoy a great reputation, which I must here state is entirely undeserved, for I believe they do more harm than good; and if my view is correct the astringent acting on the inflamed mucous surface of the rectum would tend to harden it and so give the sphincter ani more power to lay hold of and drag down an increased tract of rectal lining membrane. I may state that I do not intend to discuss here the operative treatment of hæmorrhoids, but only the preventive or palliative treatment, and I will further anticipate by stating that if my directions are carefully followed out I believe the operations for hæmorrhoids, either crushing or cutting, will become very rare. I will assume my patient to have the condition described—namely, a ring of prolapsed rectum protruding through the anus and covered more or less completely with distended and inflamed veins. According to the severity of the case I should put the patient in bed and in extreme cases apply a few leeches—two or three if necessary. This, followed by a poultice and bathing with a soothing poppy-head lotion, invariably reduces the inflammation, and in the course of a day or two, with rest in bed, allows the hæmorrhoids and prolapse generally to be returned. Matters are now much simplified and the patient is in a fair way towards recovery. The next and most important point in treatment is what has to take place at the time of the next defecation. For this I am indebted to the suggestion of a patient. Whether it is generally known or not I cannot say, but I do know its importance has never, in my opinion, been sufficiently insisted upon. This is that the patient must lie on his back when his bowels act, and use a bed-pan or other such vessel. By doing this, from some mechanical cause that I will try to explain, the seat does not come down, there is no extrusion of mucous membrane or hæmorrhoids through the anus and the dire train of symptoms I have before described is thus avoided. The reason of this is more or less obvious. The increased and unnatural propulsive power obtained by using the tuberi ischii as fulcra fixed against the stool is lost and there is rather less than the natural propulsive power, together with the loss of the action of gravity. Be the cause, however, what it may, by thus defecating in the recumbent posture, there is neither prolapse of the hæmorrhoids nor of the seat, and if the operation be followed by bathing with a soft sponge and warm water and the application of the following ointment you will be surprised at the wonderful improvement that takes place in the patient. The ointment I have just alluded to consists of one part of the red oxide of mercury ointment to three parts of spermaceti ointment. It seems to both cool and soothe the part and if freely used after each motion and in bad cases about once a day besides will cure or greatly relieve hæmorrhoids and cure cases of fissure of the anus without having recourse to the knife. All this, you will say, seems vastly simple and agreeable and I have no doubt you are somewhat sceptical as to its being quite as beneficial as I seem to think. In answer to that all I can say is, try it and you will find it will do what I have said and more. Of course, in addition to the above local treatment a little tonic or tonic and aperient may prove useful, such as the sulphate of iron combined with a little sulphate of magnesia and peppermint water or some mineral aperient water. Moreover, it is just as well to avoid the use of acrid, rough and irritating papers for cleansing purposes.

## ABSTRACT OF THE

## Middlemore Lectures

ON THE

## RETINAL AFFECTIONS OF BRIGHT'S DISEASE AND DIABETES,

*Delivered at the Birmingham and Midland Counties Eye Hospital,*

By ROBERT SAUNDBY, M.D. ED., F.R.C.P. LOND.,

PROFESSOR OF MEDICINE, MASON COLLEGE; PHYSICIAN TO THE GENERAL HOSPITAL; CONSULTING PHYSICIAN TO THE EYE HOSPITAL.

*Lecture I.*—The following classification of the retinal affections of Bright's disease formed the basis for the descriptions given by the lecturer:—(1) Diffused opacity; (2) white patches—(a) rounded soft edged areas generally situated near the disc and (b) smaller, brighter, often radiated specks, generally near the yellow spot; (3) hæmorrhages; (4) optic papillitis; (5) diffuse retinitis; (6) secondary atrophic changes; (7) general retinal periarteritis. General retinal periarteritis was included in this classification because, although not solely, it is usually associated with Bright's disease and has therefore as much claim to be regarded as one of the retinal affections met with in Bright's disease as any of the forms more usually recognised. The pathological explanation of all these changes was sought in the dyscrasia which sets up, first, nutritive disturbances, and, secondarily, inflammatory and degenerative changes in the tissues. The minute histological details of each were fully described. The course of the inflammatory lesions was shown to be not necessarily hopeless of cure, though more or less permanent structural change might remain; even the degenerative spots sometimes disappear; cases illustrating these facts were quoted. The difficulty of assigning any absolute diagnostic value to these appearances was pointed out and illustrated by drawings and cases. On the other hand, the prognostic meaning of the degenerative white specks (b), of diffuse neuro-retinitis and of general periarteritis in otherwise well-assured cases of Bright's disease is well defined and of the most serious character. The lecture was illustrated by a number of diagrams and by microscopical preparations kindly lent by Mr. E. Treacher Collins, Mr. Lawford and Mr. Priestley Smith.

*Lecture II.*—After a brief historical introduction the lecturer described the retinal affections of diabetes in accordance with Hirschberg's recent classification: (1) Retinitis centralis punctata diabetica, in which there is a characteristic inflammation of the central portion of the retina, giving rise to the appearance of bright spots often coalescing and frequently accompanied by hæmorrhages; (2) retinitis hæmorrhagica diabetica, in which the essential process is hæmorrhage followed by inflammatory and degenerative changes; (3) mixed cases. The disease in all its forms occurs only in persons of middle or advanced life and in cases of diabetes of some standing. It is generally bilateral and causes disturbance of vision, the patients complaining of a mist before their eyes. In the first form the ophthalmoscope reveals groups of small, clear, bright specks situated in the structure of the retina, in and around the disc, occurring on the nasal as well as the temporal side, never radiated in arrangement, but often occupying large areas; never pigmented, but accompanied by fine punctiform hæmorrhages. It is never attended by optic papillitis or diffuse retinitis. Newly formed bloodvessels have been observed and there is a decided tendency to the occurrence of large hæmorrhages into the vitreous. This description was illustrated by a case and the fundus oculi shown by means of Mr. Priestley Smith's demonstrating ophthalmoscope. The pathology of the affection was held to be dependent on the diabetic dyscrasia which leads to nutritive changes in the walls of the vessels and to the effusion of albuminous material into and between the layers of the retina. In the second form the hæmorrhages are usually punctiform but may be striated and are situated all over the retina; their source is not the superficial retinal vessels and their rounded shape indicates that they are situated below the nerve fibre layer. There may be haziness of the retina, dependent on some degree of

oedema. The hæmorrhages are due to vascular degeneration caused doubtless by the dyscrasia, but the histological details have not been worked out. The course of both is progressive and no instance of recovery has been recorded, although temporary improvement in vision occasionally takes place. The first form is highly characteristic when well marked, but the diagnosis should always be confirmed by examining the urine. Little is known definitely as to the prognostic importance of either, but on general grounds it is probable that they indicate an advanced degree of those nutritive derangements which herald a fatal termination.

This lecture was illustrated by drawings and microscopical sections, the latter being kindly lent for the purpose by Dr. Stephen Mackenzie.

## TWENTY-FIVE CASES OF SUPRA-VAGINAL AMPUTATION OF THE CERVIX UTERI FOR CARCINOMA.<sup>1</sup>

By FREDERIC BOWREMAN JESSETT, F.R.C.S. ENG.,  
SURGEON TO THE CANCER HOSPITAL, BROMPTON.

In bringing these cases before the profession I wish it to be understood that I do so for the purpose of giving my support to the operation of supra-vaginal amputation of the neck of the uterus in those cases only in which the cancerous growth is limited to the external os or the cervical canal. If the vaginal wall or the body of the uterus are implicated, then in my opinion the operation is contra-indicated. The cases I am now reporting are those on which I have operated during the years 1889-90-91. With the exception of one or two, all the specimens were examined microscopically after removal and pronounced to be carcinoma. The one or two cases referred to were noted as doubtful cancer, but these had all the clinical aspects and characteristics of malignancy. The following are brief notes of the cases and, as will be seen, I have arranged them in chronological order.

In the year 1889 I operated on four cases:—

CASE 1.—Mrs. —, aged sixty. Large family; duration of disease some months; os ulcerated and hardened; the cervix feels thickened and somewhat nodular; uterus freely movable; vagina free; supra-vaginal amputation performed on May 1st, 1889. The patient made an excellent recovery and had no recurrence until September, 1891, when the disease reappeared. She declined further operative interference.

CASE 2.—Mrs. —, aged sixty-one. Three children; duration of disease some months; os ulcerated, extending into cervical canal; bleeds readily; offensive discharge; supra-vaginal amputation performed on July 16th, 1889. The patient made an excellent recovery, remaining free from disease until her death, which resulted two years later from bronchitis. The uterus post mortem, which I was enabled to get, was absolutely free from any recurrence of the disease.

CASE 3.—Mrs. —, aged forty-two. Four children; duration of disease six months; os presented a ragged, ulcerated surface; cervix hard and thickened; uterus movable; vagina free; supra-vaginal amputation performed on Sept. 22nd, 1889. The patient made a good recovery, and is at present free from any recurrence.

CASE 4.—Mrs. —, aged forty-one. Two children; duration of disease twelve months; posterior lip of os thickened and rough; deep ulceration, extending into cervix; uterus movable; vagina free; supra-vaginal amputation performed on Dec. 21st, 1889; recovery; no recurrence; suffers a good deal from pain at ordinary menstrual periods.

In the year 1890 I operated on eleven cases:—

CASE 5.—Mrs. —, aged fifty-four. Father died of cancer of stomach. Two children; duration of disease five months; os and cervix indurated and somewhat ulcerated; uterus enlarged and only slightly movable; supra-vaginal amputation performed on Feb. 2nd, 1890; stump healed slowly; recovery, but the disease returned in three months.

CASE 6.—Mrs. —, aged twenty-nine. Four children; duration of disease six months; the cervix is hard and thickened, the os ulcerated and cervix fissured; uterus mobile;

vagina free; supra-vaginal operation performed on March 1st, 1890; recovery; still free from any recurrence.

CASE 7.—Mrs. —, aged fifty-four. Sister died of cancer of the uterus. Two children; duration of disease eight months; cervix enlarged and indurated; vaginal surface free; offensive discharge; uterus movable; supra-vaginal amputation performed on March 25th, 1890; rather severe hæmorrhage; recovery; recurrence in a few months.

CASE 8.—Mrs. —, aged forty-five. Aunt died of cancer. Duration of disease ten months; three children; cervix enlarged, indurated and ulcerated; several isolated nodules on cervix; uterus movable; supra-vaginal operation performed on April 20th, 1890; recovery; no recurrence.

CASE 9.—Mrs. —, aged thirty-five. Duration of disease eight months; cauliflower growth from cervix; uterus movable; supra-vaginal operation performed on April 14th, 1890; died of pelvic cellulitis.

CASE 10.—Mrs. —, aged forty-two. Six children; duration of disease ten months; irregular ulcerated growth from cervix; vagina free; uterus movable; supra-vaginal amputation performed on May 20th, 1890; recovery; disease recurred in a few months.

CASE 11.—Mrs. —, aged sixty. Father died of cancer of liver. Two children; duration of disease four months; large cauliflower growth from cervix, bleeds freely when touched; uterus freely movable; supra-vaginal amputation performed on Aug. 9th; free hæmorrhage; recovery; well when last seen.

CASE 12.—Mrs. —, aged thirty-nine. Four children; duration of disease twelve months; cervix ulcerated and ragged; uterus somewhat fixed; offensive blood-stained discharge; supra-vaginal operation performed on July 26th; disease extended into the body of the uterus; patient recovered slowly; the disease recurred immediately.

CASE 13.—Mrs. —, aged forty-three. Eleven children; duration of disease nine months; irregular growth of considerable size springing from cervix; left side of os more especially affected; a good deal of hæmorrhage at times; supra-vaginal amputation performed on Aug. 12th, 1890; patient made good recovery; no recurrence subsequently.

CASE 14.—Mrs. —, aged fifty-four. One child; duration of disease six months; extensive ulceration of os; cervix hard and indurated; uterus movable; supra-vaginal amputation performed on Nov. 7th, 1890; sharp hæmorrhage; forceps left on; patient made good recovery; no signs of recurrence subsequently.

CASE 15.—Mrs. —, aged fifty-seven. One child; duration of disease twelve months; well defined rough, irregular growth from cervix; vagina free; supra-vaginal amputation performed on Dec. 5th, 1890; good recovery; no recurrence at present time.

In the year 1891 I operated on ten cases:—

CASE 16.—Mrs. —, aged fifty-one. Duration of disease twelve months; hard irregular mass springing from the os-uterus, freely movable; supra-vaginal amputation performed on Jan. 30th, 1891; recovered; no recurrence.

CASE 17.—Mrs. —, aged forty-five. Duration of disease eight months; ulcerating mass protruding from cervix; uterus freely movable; vagina not implicated; supra-vaginal amputation performed on Feb. 16th, 1891; recovery; no recurrence at present date.

CASE 18.—Mrs. —, aged forty-seven. Three children; duration of disease six months; cervix infiltrated with growth; vagina free; uterus freely movable; supra-vaginal amputation performed on March 26th, 1891; good recovery; no recurrence.

CASE 19.—Mrs. —, aged forty-five. Duration of disease six months; large cauliflower growth extending half way down vagina; vaginal walls implicated posteriorly; supra-vaginal amputation and removal of disease with scissors performed on May 17th, 1891; patient gradually sank and died June 3rd. Unsuitable case.

CASE 20.—Mrs. —, aged forty-four. Married; three children; duration of disease seven months; os uteri deeply ulcerated and cervix considerably thickened and hard; supra-vaginal amputation performed on May 29th, 1891; good recovery; no recurrence subsequently.

CASE 21.—Mrs. —, aged forty-five. No children; duration of disease twelve months; large ulcerated mass protruding from cervix, implicating vaginal wall; supra-vaginal operation performed on July 12th, 1892; good recovery; disease recurred in October.

CASE 22.—Mrs. —, aged forty-five. Seven children (two miscarriages); duration of disease ten months; large hard ulcerated mass implicating both lips of the os; uterus freely

<sup>1</sup> Abstract of a paper read before the Gynecological Society on Dec. 8th, 1892.

movable; vagina free; supra-vaginal amputation performed on Aug. 4th, 1891. Good recovery; no signs of recurrence subsequently.

CASE 23.—Mrs. —, aged fifty-one. Five children; duration of disease five months; deeply ulcerated condition of os cervix; infiltration hard; uterus movable; vagina free; supra-vaginal operation performed on Dec. 5th, 1891; good recovery; no recurrence subsequently.

CASE 24.—Mrs. —, aged forty. Eight children; duration of disease two years; small eroded surface at posterior lip of os, with great thickening and induration of cervix. This patient was treated for some time without effect. Supra-vaginal amputation performed on Dec. 18th, 1891; made a good recovery and free from recurrence at present.

CASE 25.—Mrs. —, aged fifty-one. Six children; duration of disease three months; deeply ulcerated patch on posterior lip of os, the edges of which are roughened and everted; bleeds freely; supra-vaginal operation performed on Dec. 19th, 1891; good recovery; no recurrence at present.

From a study of these cases I think a valuable lesson may be learnt. In Cases 5, 7, 10 and 12 recurrence took place within a very short time of the operation. It may be taken therefore that they were unsuitable for this special form of operation. In Cases 5, 7, 10 and 21 no doubt total extirpation of the uterus per vaginam would have been more likely to have been of permanent benefit; while in Case 19 simple curetting and plugging with chloride of zinc wool might have been the better treatment.

*Remarks.*—I am quite in accord with Drs. John Williams, Schroeder and Hofmeier, whose statistics go conclusively to show that when carcinoma of the uterus is seen early and the disease is limited to the vaginal portion of the organ, supra-vaginal amputation is all that is necessary and it is useless to put the patient to the extra risk of total extirpation. It may be well here to define my meaning of supra-vaginal amputation as applied in this paper. It is not only the amputation through the cervix, by which operation the neck of the uterus is removed, but also the removing at the same time a large cone-shaped piece from the fundus of the uterus, which cone may if necessary be extended to the fundus. Gusserow gives the mortality after supra-vaginal amputation when performed with the knife at 9.09 per cent. and with the galvanic cautery at 7.75 per cent. Dr. Post, in the *American Journal of Obstetrics*, November, 1887, in 700 cases of vaginal hysterectomy he had collected, gives the mortality at 24 per cent. Since that time no doubt the methods adopted for this latter operation are much improved, but even Professor Martin (Berlin) gives his mortality at 16.6 per cent.; while, on the other hand, Leopold and Scenger give their mortality as low as 6.2 and 8.3 per cent. respectively. There can be no doubt, however, that the deaths after supra-vaginal amputation are considerably less than after total extirpation, and I think I have shown that the results obtained are such as to warrant us in advising the former operation in preference to vaginal hysterectomy. A few words as to the class of cases in which the supra-vaginal operation of the cervix is applicable. They may be summarised by saying that, in my opinion, if a case of carcinoma of the uterus, in which the disease is limited to the vaginal portion of the viscus and the fundus is free, the uterus being movable and the vaginal not implicated, such a case is one suitable for the high operation. By this operation I mean that a good-sized conical piece should be removed above the disease. In those cases in which the fundus is implicated, but the uterus is freely movable, I agree with Martin of Berlin and Skene of Brooklyn that nothing short of total extirpation of the entire organ is likely to be of any service. In those cases of the series which I have brought forward in which neither of these operations is indicated, as in Case 19, I think there is another course of treatment available which may be of great benefit in prolonging life and lessening pain; but of this I hope on a future occasion to give my experience. For the present I may say that this paper is based entirely on my own practice and upon those cases which have come under my notice, and I trust that should the profession think well of the treatment it will be given a fair and impartial trial.

Buckingham Palace Mansions, S.W.

**SUPERANNUATION GRANT.**—Dr. Edward M. Shirriff of Kingston-on-Thames, lately medical officer of the Ham sanitary district of the Kingston Union, has been granted a superannuation allowance of £21 per annum.

## A CASE OF CONVULSIONS PROVING RAPIDLY FATAL.

By G. MATHESON CULLEN, M.D. EDIN.

THE following case of convulsions is of some interest on several accounts. In the first place, the patient was a typically healthy girl and had not been ailing in the least when she was suddenly struck down by this illness; secondly, the diagnosis was not by any means easy; and finally, the convulsions ended in death within five or six hours.

A female aged sixteen years and a half, tall for her age, strong and robust; employed in a circus as a supernumerary. She had scarlet fever when a child, but otherwise she never had a day's sickness. Mother and only sister died of tuberculous affections; no brothers; father alive and well. On the evening of Jan. 6th, 1891, she went to meet a male friend of hers, with whom she spent a couple of hours in a public house. She had several glasses of rum but was not intoxicated, because she left her friend and took her part in the circus as usual. She conducted herself there somewhat strangely, but as this was only regarded as some novel "fooling" on her part no particular attention was paid her. The performance over, she went straight home and saying that she felt tired she went to bed; this was about 10 P.M. So tired was she in fact that she did not undress, but lay down in her clothes. Her father left the house for his work a little before five the next morning and she rose to lock the door after him. He was surprised to see her with her clothes on and asked her the reason of it, but she only muttered a few words to the effect that he "need not mind" and closed the door quickly upon him. The father returned for his breakfast at 9 A.M., and his niece, who had slept with his daughter during the night, told him that that girl had not risen yet. After breakfast he went to the bedroom and tried to rouse the sleeper, but without success. About 10.30 A.M. she began to have "fits," and I was called in about 11.30 A.M. When I arrived she was quite comatose, insensible to everything, with complete anaesthesia of skin. Her cheeks were flushed; skin warm and moist; pulse 100, very feeble; temperature in right axilla 105.9°, in left 106.2°; respiration shallow, 60 per minute; pupils were widely dilated and insensible to light, right more dilated than left; conjunctival and superficial skin reflexes absent; knee-jerk absent, but ankle clonus marked. Convulsions were present, and were somewhat peculiar as regards the order of their occurrence. First of all the eyes twitched to the left, then the head jerked in the same direction, then the left arm, and finally the left leg became affected with spasms. The whole left side of body being thus affected the convulsions became more rapid, and at last became general, the right side being affected as well as the left, and then it required all the force of several bystanders to prevent her being jerked on to the floor. The convulsions then grew feebler and disappeared altogether on the left side, while they still persisted on the right, but gradually all movement ceased and the girl lay quite still with paralysis of all the extremities. The breathing became rapid and stertorous, with some frothing at the mouth, while the convulsions were general, but after the acme of the fit the respiration grew less and less forcible till all movement ceased, and then it almost stopped, the breathing being carried on by a few sighing respirations, three or four at a time, and separated by intervals of twenty or thirty seconds. The convulsions from first to last extended over about ten minutes, while the period of calm lasted from three to five minutes, after which the eyes would twitch to the left and the whole scene be acted over again. This regular alternation went on during the hour and a half I was able to watch the patient, and it continued I am told till 4 P.M., when, in the calm period following a fit, she quietly expired. There was nothing abnormal to be made out in any of the organs. The lung sounds were masked by mucous râles. No relaxation of any of the sphincters. About a teacupful of apparently normal urine was drawn off by catheter. On examination for albumen no trace was detected.

*Diagnosis and necropsy.*—My first idea on seeing the paralysis of the right side and convulsions on the left side was that the case was one of hæmorrhage into the left internal capsule with subsequent rupture into the lateral ventricles. The tuberculous history suggested a tuberculous tumour as the starting-point of the bleeding. The subsequent bilateral

nature of the convulsion, however, was against any lesion demanding an absolute destruction of brain tissue at the point considered. Poison had been suggested by the friends, who were naturally startled by the suddenness of the attack. I was unable, however, to reconcile the symptoms with those following any poison. Uræmia and pyæmia were equally untenable. Tuberculous meningitis was not very likely, because of the robustness of her body and also by reason of her previously good health, but the tuberculous family history and the difficulty of finding anything more likely made me incline towards it as the diagnosis. On the whole, however, I was very glad that the father was determined to sift the matter to the bottom and had called in the police to investigate the case. Accordingly, on Jan. 8th, 1891, Dr. Harvey Littlejohn made a post-mortem examination on the case, and at his invitation I was present at it. All the organs healthy; a few cysts in the kidneys, but capsule stripped off readily and there was no apparent disease. The examination of the brain showed nothing abnormal save a slight increase in the puncta hæmorrhagica of the white matter.

This, then, was a case of idiopathic convulsions, and because of their periodic character they might be classed under the heading of epilepsy, especially under that form of it which is known as "status epilepticus." On the other hand, the tonic convulsion which is so constant a feature in epilepsy was here conspicuously absent. Still I am sorry that the possibility of "status epilepticus" did not occur to me, for then I might have been led to try amyl nitrite, which Sir J. Crichton Browne has found so valuable in these cases. However, with the high temperature present in this case, I fear not even that remedy could have averted the death which appeared imminent at the first moment I saw the patient. Croton oil and bromides were alone tried.

Lauriston-place, Edinburgh.

## A TYPICAL EXAMPLE OF THE EFFECTS OF MOUNTAIN AIR.

By A. T. TUCKER WISE, M.D. BRUX.

AT the suggestion of Sir Andrew Clark I publish the following case as illustrating the rapid curative effects of mountain air in unilateral consolidation of the lung.

Dr. X—, aged thirty-one, was advised by Sir Andrew Clark to winter in the Alps and came under my observation at Davos towards the end of October, 1891. His illness commenced in the month of May with cough and profuse hæmoptysis after influenza. On his arrival here I found him suffering from a paroxysmal cough, chiefly troublesome in the morning and accompanied by muco-purulent expectoration containing tubercle bacilli in moderate numbers. The pulse was 116 at rest, running up to 140 on movement; temperature 97.2°; urine, sp. gr. 1015, phosphatic. Night sweats had ceased previous to arrival. The chest formation and family history were good. He had lost 20 lb. in weight, was anæmic and complained of weakness, shortness of breath and depression. On physical examination of the chest limited expansion was observed on the left side with marked dulness extending from the clavicle to the third intercostal space. Posteriorly there was dulness over the supra-spinous fossa and between the border of the scapula and spine on a level with the first and second dorsal vertebra. From time to time a few clicking râles were detected with puerile breathing. Vocal fremitus was not marked on either side, the difference in vibration having little significance. Chest measurements gave 19 in., expanding to 19½ in., on the right side: 18 in., expanding to 18½ in., on the affected side during deep inspirations. The other organs were normal. An irritable condition of the heart was treated with aconite and hydrocyanic acid; then a tonic system of treatment was adopted—iodide of arsenic with quinine &c. In the first week the pulse dropped from 116 and 140 to 84 at rest and 104 on movement. After the second week the dulness over the upper part of the left lung had completely disappeared and the patient was rapidly regaining lost ground. Progression towards recovery, with gradual expansion of the chest and gain in flesh and strength, was uninterrupted until February, when the following note was made: Insignificant difference in respiratory murmur; no dulness or râles of any kind; three or four bacilli found

in expectoration on Jan. 26th; no expectoration since then; pulse 80 to 84.

*Remarks.*—This case illustrates the rapidity of recovery in lung lesions which is occasionally observed at these elevations. Sir Andrew Clark regarded the consolidation, not as miliary tubercle, but rather as being due to a caseous condition of disease. This was subsequently borne out by the march of the affection. No consolidation depending on a miliary deposit would have cleared up so readily. The patient has now (October, 1892) resumed his practice, is in robust health, weighs 13 st. 5 lb. (gained 28 lb. in Davos) and presents no sign of disease whatever with the exception of a faint expiratory harshness heard over the left apex, which would scarcely attract the attention of any auscultator unacquainted with the previous facts. The climatic advantages at high altitudes in relation to pulmonary disease are, to put it shortly, as follows: 1. Dryness of the air and its comparative freedom from micro-organisms and atmospheric dust, entailing a lessened liability to catarrh and irritation of the bronchial tract and drying the lungs. 2. Profusion of sunlight; with the low temperature the heat of the sun is easily borne and the violet rays of the spectrum act chemically on the blood, increasing the hæmoglobin. 3. Diminished barometric pressure; this facilitates chemical action in the blood and tissues, favours vaporisation of moist secretions in the lungs and aids pulmonary circulation and expansion. 4. The general stimulus of high levels, producing exhilaration and an increase of nutrition.

Davos Platz.

## THE PHYSIOLOGICAL EFFECTS OF ALTERNATING CURRENTS.

By W. S. HEDLEY, M.D. EDIN.

THERE seems no reason to doubt that, under certain conditions, the physiological effects of rapidly alternating currents vary with the frequency of the alternations. M. Tesla has proved this of currents with enormously high frequencies, and other observers have proved it of currents with comparatively high frequencies. It is easy to show by experiment that, under certain conditions and limits, the effects of an alternating current, so far as sensation and muscular contraction are concerned, decrease as the rapidity of alternation increases. Perhaps we may say that, under certain conditions, the severity of the physiological effects of an alternating current varies in an inverse ratio with the frequency of alternation. M. Tesla found that the current required to keep a tube of a certain length at a certain degree of brightness with the ordinary low frequencies was probably powerful enough to produce dangerous shock, but that if the number of alternations was raised to 20,000 per second the same degree of brightness was retained in the tube, but the current could be "scarcely felt." He explains that this is primarily due to the fact that a much smaller potential is required to produce the same light effect and also to higher efficiency in the light production. We need not follow the explanation as to light, and, so far as I know, the question of physiological effect is not further dwelt upon by M. Tesla. In discussing this experiment Professor Houston<sup>1</sup> considers that perhaps the principal cause why the high frequency of alternation is comparatively harmless is to be found in the fact that it is "in accordance with modern ideas to consider the electric energy as rained down on the surface of the conductor from the space outside it," and that if this view be correct what happens in the case of alternating currents is that, so to speak, "the bolt is no sooner hurled at the body than it is hurled away from it." In considering the possibility of getting something therapeutically practical and useful out of this and similar experiments, it is of importance in the first instance to make an attempt to discover what is the immediate electrical factor in producing these physiological effects. Is it mere rapidity of alternation *per se* or is it something that results from this rapidity of alternation? With a view to enlighten myself on these points I proceeded as follows: Taking a large induction coil and obtaining the interruptions by means of an electric motor in the circuit, having its fly wheel arranged with contact points touching a spring as it revolved and so designed that a musical sound would denote the number of alterna-

<sup>1</sup> A paper read before the Electrical Section of the Franklin Institute.

tions, I obtained results of which the following table gives an example:—

Rate of alternation.	Current in primary.	Electro-motive force in primary.	Total energy.	Effects (of secondary) on sensation and muscular contraction.
Per second.	Milliampères.	Volts.	(Watts).	
(a) 808	160	2 8	0'42	Well marked.
(b) 2428	120	"	0'34	Slight.
(c) 4482	100	"	0'28	Nil.

It thus appears that increase of rapidity of alternation brings down current strength.

*Control Experiment 1.*—A large coil was used which, when worked with its own spring and a current of 2 ampères at 8 volts, gave a spark of a quarter of an inch (5800 volts calculated by De la Rue and Müller's sparking tables). When the spring was screwed down and the motor<sup>2</sup> used to make contact and run at (my) medium speed—i.e., about 2428 alternations per second—the current in the primary fell to 0'75 ampère and the spark of the secondary to a little more than an eighth of an inch (say, 3000 volts), again showing the fall in current strength with a rise in frequency.

*Control Experiment 2.*—As a control experiment of both the above I went on to test the effect on sensation and muscular contraction of varying rates of alternation, but with the current in primary kept constant. Motor run as above, but coil worked by large Leclanché battery with a cell collector. Having obtained well-marked sensation effects and muscular contraction at a low speed, with a certain current strength, the speed was increased, with the effect that the current in primary was diminished. More cells were then thrown into circuit and the current brought up to its original value; the result was that the physiological effects became as marked as before. The inference therefore seemed tolerably clear that sensation and muscular contraction are not so much affected by rate of alternation as by the amount of current strength. Taken together, these experiments point as follows:—(1) That increased rapidity of alternation diminishes the current in primary, and therefore, of course, the induced current in secondary; (2) that with this increased rapidity and diminished current strength there is diminished physiological effect, but that if, with the increased frequency of alternation, current strength be kept up to its original point there is no such diminution apparent; (3) that therefore the current strength is one great immediate factor in producing these physiological effects. It seems that changing the frequency of alternation, by the motor method at least, is one way of influencing current strength.<sup>3</sup> How this may occur is a different question, but a highly interesting one, both from a medical and from an electrical point of view.

Norfolk-square, Brighton.

## CASE OF DRAINAGE OF THE BLADDER THROUGH THE PERINEUM, WITH COMPLICATION.

By ANDREW KEY, M.D. EDIN. &c.

THERE are some points of very great interest in connexion with this case which I think make it worth publishing. I have condensed my report of it as much as possible and do not enter into minute details. About nine years ago a gentleman, then aged fifty-four, consulted me. He had for a good many years suffered from an irritable condition of his bladder. On examination this was found to be due to enlargement of the prostate, producing the usual symptoms—increased frequency of micturition, some difficulty in the act, with much more than the usual pain; there was no stone in

the bladder and the urine was in all respects healthy. These symptoms gradually increased in severity until, during the last three months of 1889, his life became miserable. His business engagements were very numerous, necessitating his presence frequently in Edinburgh, Dundee &c.; but his bladder symptoms had become so much intensified that he was almost unable to leave home. At this time, three months before he underwent the operation, he began to pass more urine than the normal quantity and on examination this was found to be of low specific gravity. In addition to an enlarged prostate he was found to have further trouble from diabetes insipidus. He was passing from 90 oz. to 100 oz. of urine in the twenty-four hours, of a density of 1006. As usual in such cases, he suffered greatly from thirst. No treatment had any effect upon this state of matters. During the last month of 1889 his sufferings were very great—he had to micturate every half hour, with great difficulty and increased pain. I had advised him to pass a soft catheter night and morning, or at least every night, as it was very evident that he never emptied his bladder. He could manage this well enough, but the urethra was so irritable that he had to abandon the attempt. The prostate was now so enormously enlarged that mere palliative treatment was evidently useless. The only mode of relief seemed to be by establishing an outlet for the urine through the perineum. He consented to this and the operation was performed by Professor Annandale of Edinburgh on Jan. 11th, 1890. Chloroform having been administered by me, the ordinary lithotomy staff was introduced and the bladder opened into in the middle line of the perineum. This staff was then withdrawn, a straight grooved one was passed through this opening in the perineum into the bladder and by means of it the opening was enlarged. Although he had micturated immediately before the operation, quite a pint of urine escaped into a basin. On passing the finger into the bladder the prostate was found to be enormously enlarged, Professor Annandale remarking that it was the largest, or one of the largest, he had ever seen. The operation was easily and quickly done and without a hitch. It was now clearly seen that a deep pouch had been formed behind the enlarged prostate which no catheter could have emptied and which at all times contained about a pint of urine, accounting for the frequent desire to micturate and the unsatisfactory result thereof. A strong stiff gutta-percha tube, smoothly rounded at the internal end and perforated, was tied into the bladder, which was washed out twice a day with a warm solution of boracic acid. As the patient resided twelve miles from Montrose, my son, then assisting me, remained with him for the first four days and nights; all had gone well and he was enjoying freedom from pain and quiet rest. But exactly a week after the operation—at 4 A.M. on the morning of the 18th—a messenger arrived at my house stating that Mr. S— had been wakened suddenly with most acute pain in his left leg and that it had become rapidly greatly swollen. I went at once and diagnosed embolic clot in the femoral artery. I found the leg already double the girth of the other and the suffering intense. I administered a large dose of morphia subcutaneously and put up the leg in cotton-wool with a flannel bandage. Sleep soon followed and by morning the pain was much relieved. It was now evident that the case would be a tedious one, requiring much care. A thoroughly qualified nurse was got and the patient placed on a large water pillow. The embolic clot was a very serious complication, possibly due to the vitiated condition of the blood of one suffering from polyuria. But the case became more grave when exactly a week after, on the 25th, the right leg went in the same way as the left had done, the treatment being of necessity the same. Dr. Johnston of Kair repeatedly saw the patient with me and the prognosis was a very grave one. Phlebitis did supervene, however, all over the superficial veins of the legs, thighs and lower abdominal region. The patient was now very ill and utterly unable to help himself in any way. Fortunately the temperature did not rise and the constitutional symptoms were not so severe as might have been expected. He had excessive thirst, due to the polyuria, which still persisted. He could take plenty of food and a sufficient amount of stimulants—claret, occasionally a little champagne, but chiefly whisky and potash water. The legs were carefully looked after, well wrapped in cotton wool and no symptom of gangrene ever showed itself. Another week having passed without any further complication I was beginning to hope that my patient, who had been an exceedingly temperate, healthy man with a splendid constitution, would pull through,

<sup>2</sup> Driven with a current of 1·2 ampères from a bichromate battery.

<sup>3</sup> It is evident, therefore, that in all such experiments attention ought to be paid to the possible reduction of the initial electrical energy by reason of increased frequency. It is possible, although so far as I know nowhere stated in the published records of other experiments, that instruments were used which enabled these high frequencies to be obtained without diminution of current strength.

when he was seized on the morning of Feb. 1st with a most intense rigor, followed by the usual very hot stage and excessively profuse perspiration. For the first week after this rigor he had two rigors quite as severe every twenty-four hours, but without any marked periodicity, and was then left so exceedingly weak and ill that recovery appeared utterly hopeless. Dr. Johnston consulted with me repeatedly and at the end of this week of misery we concluded that he must certainly die. When the first rigor seized him he was put upon large doses of quinine and his allowance of stimulants was increased. Fortunately he could still take a fair amount of nourishment. His stomach retained everything, and this gave us a little hope. Another point in his favour was that even during the highest state of fever the temperature did not go much beyond 103°, falling to almost normal after the sweating stage. At the end of a week the rigors diminished in frequency to one a day, then one in two days, and before they finally left, which they did at the end of three weeks, one every third day, also gradually lessening in intensity. His weakness was now extreme. During all this time the wound in the perineum was perfectly healthy; no abscess, either external or internal, was formed. It was three or four months before any diminution of the circumference of the legs was apparent. All this time the urine had been daily carefully measured and the density taken. During the rigors, and when the profuse perspiration existed, the quantity had diminished. It certainly increased again, but never was so much as 90 oz. or 100 oz. in the twenty-four hours, and the density began to rise. In short, the blood got rid of the poison and the urine gradually became normal in quantity and quality. It was so at the end of three months after the operation and has remained so until now. I do not think the operation had anything whatever to do with the prolonged and varied illness; the blame must be attached to the state of the system, whatever that might be, caused by the polyuria. After the rigors had quite passed away, a long flexible indiarubber tube, with a stopcock at the end of it, was attached to the stiff tube in the bladder, and as his urine could be retained for about four hours the stopcock was then turned and the bladder emptied. The stiff tube had so completely accommodated itself to the perineal opening that there was little or no leakage. This tube was easily removed and a fresh one put in about every ten days.

At the end of seven months after the operation the patient was able to be out of bed and lie on a couch, and was soon afterwards assisted daily into another room. His health was now perfectly restored and he gradually recovered the use of his legs. In the month of December, nearly twelve months after the operation, he was able to go to Edinburgh and attend to business, doing so ever since, with frequent journeys elsewhere. The only pain or inconvenience he suffers from, and which he has always had since the operation, is a spasmodic contraction of the bladder, more or less daily, with the passage of a little urine through the urethra.

There are one or two points in connexion with this case which I should like to bring prominently forward. For many years before suffering from his bladder trouble the patient conducted a very large business. He had often very little opportunity for micturating and gradually accustomed himself to do without emptying his bladder for ten or twelve hours. I think one of the functions of the prostate gland is to assist the vesical sphincter. The prostate began to enlarge at an unusually early age, when the patient was not much over forty. Professor Annandale was astonished at its size. Then the irritation of the enlarged prostate or that of the urine, constantly retained in the bladder, had in some way produced the polyuria, which disappeared with the trouble caused by the enlarged prostate. Again the polyuria was disposed of in the same way as any other form of blood poisoning, but without any tangible manifestation, by severe rigors and intense diaphoresis.

High-street, Montrose.

**ILKESTON COTTAGE HOSPITAL.**—At the annual meeting of the friends of this institution, held a few days ago, the chairman was able to give a very satisfactory account of the success which has attended the work accomplished during the past year. Its finances also bear a similarly favourable aspect. One pleasing feature in the career of the hospital has been the practical appreciation shown by the working classes in the progress of the charity. Reference was also made to the proposal to build a new hospital, for which funds are already to some extent available.

## AN OBSCURE CASE OF CANCER OF THE PYLORUS UNDETECTED DURING LIFE.

By J. BALMAIN MACLEOD, M.D. ABERD.,  
SENIOR VISITING PHYSICIAN, DUNDEE ROYAL INFIRMARY.

Miss C—, aged fifty years, consulted me for the first time on April 4th, 1890, for indigestion. She stated that she had always enjoyed good health till towards the end of 1889, when she had a sharp attack of influenza, from which she made a very slow recovery, and then, for the first time, symptoms of indigestion set in. The patient was a thin, wiry, pale-complexioned person. She complained of pain over the region of the stomach about an hour after taking food, which passed off in about half an hour, leaving her entirely free from pain till the next meal. Tongue very much furred; bowels constipated; appetite poor; stomach and bowels distended with flatulence. Nothing abnormal could be detected on examining the stomach. She had had no vomiting, but complained of acidity. I put her on a course of bismuth, rhubarb and soda, and carefully dieted her. On this treatment she seemed to improve, and left Dundee on May 6th for a change of air. On June 18th she again reported herself; she appeared to have improved by the change, but still suffered more or less from a fixed pain in the stomach; referred to a spot towards the left of the epigastric region. After seeing her for a few days she went to the Highlands for a further change, where she remained for about six weeks. Towards the middle of September, however, the pain appeared to increase, and was more constant than before, and now was not influenced by food; the pain was of a dull aching character, referred to a spot in the left epigastric region. She also complained very much of flatulence, with fetid eructations. Various remedies were tried, peptonised foods prescribed, but the pain persisted. Bismuth and morphia in powder were ordered, which had a decided effect in dulling the pain. About the middle of December Professor Grainger Stewart of Edinburgh saw her in consultation, and after a careful examination could detect no organic lesion, although by this time she had emaciated very much and had a cachectic appearance. He gave as his opinion that the dyspepsia was of a neurotic nature, and advised very much the same treatment to be continued. For a few weeks she appeared to rally and kept comparatively free of pain while taking the bismuth and morphia. Her appetite was wonderfully good and the food well digested, but she steadily emaciated from week to week and died on May 19th without any pain or suffering during the last fortnight of her life, and was calm and collected to the end.

On May 20th Dr. Stalker, for some time pathologist to the Dundee Royal Infirmary and my junior colleague there, kindly conducted the post-mortem examination along with me, and we found as follows: The body was extremely emaciated and anæmic, with commencing œdema of the extremities. On opening the abdomen the stomach was found adherent to the under surface of the left lobe of the liver, and was held well back. The adhesion took place all along the line of the lesser curvature of the stomach, from the pylorus to the cardiac end. The pylorus itself was surrounded by a thick hard band or ring of scirrhus cancer, interrupted only at the posterior part, where for about half an inch the ring was almost absent. A finger could very easily be passed through the pylorus. There was no dilatation of the stomach and no secondary deposit anywhere.

*Remarks.*—The great interest attaching to this case is the difficulty of diagnosis met with during life. I all along entertained a strong suspicion of malignancy (and expressed it) based upon the steady emaciation of the patient, her cachectic appearance, her period of life, and a family history of cancer, an aunt having died of the disease; but the fact that there were no symptoms of vomiting, and never had been, combined with the position of the painful spot well toward the left of the epigastrium, militated against and obscured a diagnosis of cancer of the pylorus. It is probable that there was some consecutive atrophy of the glands of the stomach,

and that this atrophy, even without pyloric stricture, may have produced the graver nutritional disorder that was apparent from the first; and the fact that the pylorus was adherent to the under-surface of the liver and was dragged to the left side beyond the reach of palpation, though immediately over the spot to which she always pointed as the seat of pain, was another obscuring element. The limited amount of organic change in the pylorus during the fifteen months she suffered under the affection is also interesting. The post-mortem examination was therefore specially instructive, and is my plea for publishing the case.

Airliebank, Dundee.

## REPORT OF A CASE OF HYDROPHOBIA.

By J. L. KERR, M.D. ABERD., C.M., F.R.S. EDIN.,  
PUBLIC ANALYST; LATE EXAMINER IN CHEMISTRY AND IN MEDICAL  
JURISPRUDENCE AND TOXICOLOGY, UNIVERSITY OF ABERDEEN.

A GIRL aged eleven years was bitten upon the hand by a stray dog on May 24th, 1892. The wounds were upon the fingers and thumb of the right hand and were small, being perforations of the skin without any laceration. I cauterised them with strong carbolic acid shortly after their infliction. They healed quickly; the girl showed no symptoms of any kind and the whole incident was well-nigh forgotten. On Nov. 29th, 1892, 189 days after the hand was bitten, she began to be ill. She had no marked symptoms during the day, but ate and drank very little and complained of pain in the right forearm and elbow. In the evening of the same day she complained of inability to swallow, and said when she tried to drink "it took her breath." She also said her heart beat very fast, which it did; the pulse rate was much accelerated and the heart's action turbulent in character. The temperature was normal. The patient had an anxious look, but no other noteworthy symptoms. She either had inability to swallow or her repugnance to do so was so great that she would not try. She passed a very restless night and in the morning the respiratory spasm and the rapid pulse rate had much increased. Any efforts to swallow liquids or solids were made with great unwillingness and produced marked respiratory spasm and general muscular spasm of the whole body in a slight degree. She complained of hunger and thirst, but no persuasion would induce her to eat, drink or suck ice. She was very lively and talkative, "like as if she was drunk" her mother said, both at this time and during the quiet periods throughout the illness. Towards the evening she had short periods of maniacal delirium, for which she apologised, saying that "she could not help it for it came on her all at once." On the third morning she had increased respiratory spasm and great hyperæsthesia of the skin, for a draught of air or a touch or the fear of a touch would produce a general spasm of all the muscles of the body. During the quiet periods her pulse rate was 138 per minute and was easily accelerated by the least excitement. She ate about ten grapes with little difficulty. About half-past two o'clock in the afternoon she had a severe attack of maniacal delirium, with loud and piteous cries, lying on the floor, the limbs moving about and the body twisting from side to side in a peculiar way. At the same time she vomited small masses of solid mucus, exactly resembling nummular sputum, and from this time onwards she was unable to swallow her saliva and spat it out almost constantly. At half-past six she had general convulsions; she lay upon her back in bed, moaned piteously and then flexed and extended the upper and lower limbs very rapidly; she was cyanosed and the eyelids became swollen immediately afterwards. After the cessation of the convulsions the jaw dropped and she was unable to close her mouth completely. The weakness increased very rapidly, and about eleven o'clock in the evening she had another attack of convulsions, not so severe as the first, followed by gradually increasing paralysis of all the muscles of the body, and she died by failure of the heart at three o'clock in the morning of Dec. 2nd, 1892.

Crawshawbooth, Manchester.

## Clinical Notes: MEDICAL, SURGICAL, OBSTETRICAL AND THERAPEUTICAL.

### MALARIA WITH RUPTURE OF THE SPLEEN AT THE END OF THE FIRST WEEK.

By SIDNEY J. PALMER, M.B. DURH., M.R.C.S.

THE following notes may be found of interest on comparison with a case reported in THE LANCET of Sept. 17th last by Dr. Bowie.

The patient aged twenty-six was admitted into hospital on Sept. 19th, having arrived the day before from the Danubian port Galatz, being a fireman on board a ship. He left the latter port on Sept. 3rd in apparently good health, though he was drinking freely whilst on shore. He worked in the usual manner until Sept. 12th, when he was suddenly seized with shivering and vomiting and had to go to his bunk, where he was treated by the captain with quinine. The shivering fits continued daily until he arrived at Liverpool on Sept. 18th. He, however, felt better and went home in a cab from the ship; feeling worse the next day he applied to the hospital and was admitted. He was found on examination to be in a very weak condition, although he was able to walk. He was very anæmic, with marked pallor of mucous surfaces and slightly jaundiced complexion. He felt very cold. Temperature 101.6°; extremities cold; tongue clean and moist. Heart: No murmur heard, but all sounds weak and distant. Apex beat not felt, best heard in the fifth space one inch inside the nipple line. Lungs: Breath sounds normal. Abdomen: Slightly tympanitic over front. Splenic area of dulness considerably enlarged (eight inches vertical, five inches in the transverse diameter). No tenderness on palpation or percussion. Liver: Slightly enlarged. He says he has never had ague before. Had rheumatic fever a year ago; all the joints affected. No other illness that he remembers. He ascribes the present attack to having drunk largely of Danube water, with which the ship was supplied at Galatz. The patient was put to bed, hot bottles applied to the feet and quinine and caffeine given internally. Five hours after admission the patient suddenly became very blanched, complaining of great pain over the abdomen. He was found to be lying on his left side, his legs drawn up and quite collapsed. He could not move on account of pain. The left half of the abdomen was found to be absolutely dull as far as the middle line and extremely sensitive on percussion. Morphia was given, but he rapidly sank and died half an hour after the initial symptoms of collapse.

*Neuroscopy, thirty-six hours after death.*—Post-mortem rigidity poorly marked. On opening the abdomen, which was considerably distended, a quantity of dark blood escaped. On further examination a large collection of dark clot was found in the left flank, surrounding and quite hiding the spleen. On removing the spleen—which was done without any force, no adhesions being present—and the adherent clots, a ragged rent was seen to extend for three inches across the lower part of the anterior margin. The rent in the capsule, which was very thin, corresponded to the tear in the spleen substance itself and there was no stripping away of capsule from surrounding spleen substance. The parenchyma was of lighter colour than usual and very soft and diffused. The spleen and clot weighed 3 lb. 2 oz.; the spleen separated from the clot weighed 14 oz. The liver weighed 62 oz., pale and greasy on section. Intestines shrunken and empty; nothing found on opening them. Kidneys, each 6 oz.; pale, otherwise healthy. Stomach empty; nothing abnormal found. The heart weighed 12 oz.; valves and apertures healthy; muscular substance pale and flabby. The lungs were healthy. The reason this case appears to be worth publishing is the rarity of spontaneous rupture occurring so early in the disease. The evidence that the malaria had only existed for seven days is undoubted, and I have not been able to find a case on record occurring so soon after the first evidence of malaria. Most of the cases on record have been where malaria was of some months' or years' standing, and generally preceded by muscular effort. Here, however, the patient was lying in bed at the time of rupture, and there is nothing to account for it except causes in the organ

itself. The case was admitted into the Northern Hospital, Liverpool, under the care of Dr. Barr, to whom I am indebted for permission to publish the case.

Seaton, Devon.

### THE TREATMENT OF SYPHILIS.

By J. McNAMARA, M.B., B.CH., B.A.O. R.U.I.

THE widespread existence of syphilis and the grave importance of correctly treating it must be my excuse for discussing the best method of dealing with this mysterious disease. I will take it for granted that mercury in some form or other is the proper drug to be administered during the primary and secondary stages of the disease. The first question then is, What is the best preparation of mercury to be given in these circumstances? Since each of the numerous preparations of mercury is believed to be of benefit in syphilis, and since the only constant factor in these various preparations is the metal itself, we must suppose that it is the metal itself which is the curative agent, and not any of the substances with which it is combined. This fact suggests the answer that the best preparation of mercury is that which in safe unirritating doses contains the largest quantity of the metal; for if mercury be the enemy of the syphilitic virus, it is inconceivable that the very small quantity of the metal contained in the one-sixteenth of a grain of the perchloride can be as useful as the comparatively large quantity contained in a grain of mercury with chalk. This theoretic advantage of preparations containing a large quantity of the metal is also confirmed by experience, for one of the most convincing proofs of the value of mercury in syphilis is its rapid and striking influence over infantile syphilis. Now, mercury with chalk is the preparation most commonly given in this form of the disease; and that the cure is more rapid than in the case of adults is, in my opinion, due to the comparatively large quantity of mercury circulating in the small body of the infant. Moreover, I have seen patients progress but slowly when taking the perchloride, but rapidly improve when put on a course of mercury with chalk. But while I hold that it is of advantage to have a large quantity of mercury circulating through the tissues of the patient, this quantity must not be so large as to produce salivation, purgation, or any other injurious effect. For when the struggling tissues are injured by mercury or by any other cause, then the enemy triumphs and the worst forms of syphilis may ensue. I hold, then, that mercury with chalk is the best preparation to be given in primary and secondary syphilis. It is the least irritating of the preparations containing a large quantity of the metal. It should be continued for a prolonged period. For mild cases in young vigorous adults the treatment should last at least seven months; for more severe cases and in patients above thirty-eight or forty for not less than a year. For an ordinary adult one or two grains three times daily, with a grain or so of Dover's powder, should there be a tendency to diarrhoea, will be sufficient. This, of course, should be combined with the avoidance of alcoholic excesses and of everything calculated to lower the vitality of the patient. For tertiary syphilis the value of large doses of iodide of potassium is undoubted and needs no discussion. I may, however, remark that the common idea that iodism is prevented by the addition of aromatic spirit of ammonia or that iodism is less likely to follow large doses than small ones is not borne out by my experience. I will conclude by referring to a class of cases not unfrequently met with, where tertiary symptoms have supervened before the secondary symptoms have subsided. These cases can be conveniently treated by a mixture containing fairly large doses of iodide of potassium combined with drachm doses of the liquor hydrargyri perchloridi in decoction of cinchona.

Sutherland-avenue, W.

### ASCARIS LUMBRICOIDES AS A COMPLICATION OF TYPHOID FEVER.

By J. S. REYNOLDS, L.R.C.P. & S. EDIN.

A BOY aged fourteen years, of good family history, came to consult me on Nov. 20th, 1891, complaining of general malaise with vomiting and pain in the stomach. On the 23rd I was

sent for to visit him at his home and found him suffering from the prodromitory symptoms of typhoid fever, with pale face, dark lips, scanty and high-coloured urine and severe typical diarrhoea. The temperature during the disease was characteristic, rising in the evening to fall again next morning and reaching a maximum of 104.2°. The tongue was furred at the sides and clear at the tip and middle. On the tenth day the "spots" appeared on the abdomen. The case progressed favourably, defervescence taking place by lysis. After sixteen days' apparent convalescence—i.e., Dec. 26th,—the temperature went up and the diarrhoea returned with its former severity. The symptoms ran a shorter course and once more the patient became convalescent. On Jan. 11th, 1892, the disease again made itself manifest, but until the 18th no especial symptom appeared. When making the morning visit to the patient I found that immediately before my arrival he had passed a large round worm of about ten or eleven inches long. From that date forward recovery was unimpeded and by Feb. 12th it was not necessary to continue visiting at the house. In the early stages of the disease an ordinary saline mixture, with two minims of tincture of aconite every four hours and ten-grain powders of salicylate of soda thrice daily, was given, no food being allowed beyond a simple milk diet. On Nov. 25th active delirium was present and continued for some days, the treatment being a sedative draught containing bromide of potassium and tincture of henbane to be taken at night as required. The diarrhoea was now uncontrollable. Fortunately at this very time there was a correspondence in the columns of THE LANCET concerning the treatment of this malady, more especially the diarrhoea—viz., tincture of iodine and carbolic acid—and having been adopted was followed by great success. The patient received one minim of tincture of iodine and one-eighth of a grain of carbolic acid thrice daily, the doses being doubled after three days. During convalescence he was put on an acid mixture, with sulphate of quinine. On recurrence of the symptoms the former treatment was again used with equal success; and also in the second relapse. After the voiding of the worm no other was passed, although the ordinary vermifuge was given. The only stimulant administered during the attacks was a tablespoonful of hot milk every hour or half hour as required. The case was reported under the Notification of Diseases Act and the usual hygienic measures carried out. The fever ran an ordinary course till the first relapse, which was thought to have been caused by a chill, the patient having come downstairs without permission. The second relapse was attributed to the presence of the parasite; and the question now arises whether both cases were not due to the same cause. As the case appears to me to be very rare, it may perhaps be of general interest to the profession.

Wolverhampton.

### OVARIOTOMY AT THE AGE OF SEVENTY-EIGHT YEARS AND FIVE MONTHS.

By HERWOOD SMITH, M.A., M.D. OXON.

L. R.—, single, was seventy-eight years old in February, 1892. She menstruated naturally from the age of sixteen to forty-five. The patient was first seen on May 25th. Six months ago she noticed her abdomen getting larger and was losing flesh. Examination: Abdomen large and tense, dull on percussion, slightly resonant in the flanks, fluctuation quite distinct (one wave). Measurements: (1) Ensiform cartilage to umbilicus, 7 in.; (2) pubes to umbilicus, 10½ in.; (3) right anterior superior spinous process to umbilicus, 10½ in.; (4) left anterior superior spinous process to umbilicus, 11 in.; (5) girth at umbilicus, 37 in. Vaginal examination: Uterus movable, tense swelling in front of the uterus. On July 10th the measurements were: (1) 7½ in.; (2) 10½ in.; (3) 10½ in.; (4) 12 in.; (5) 37 in. The operation was performed on July 12th. Incision 3 in.; pedicle thin and flat, transfixed and tied in halves with silk; wound closed with six silk-worm gut sutures and one superficial. The tumour was of the right ovary and multilocular, but the secondary cysts were very few and small; it weighed 25 lb. The left ovary was atrophied. The operation lasted fifteen minutes. The stitches were removed on the 18th and on the 20th the wound was quite healed. The patient was seen on Sept. 13th. She was then quite well, getting about and gaining flesh.

As this patient was of such an advanced age I thought the case not unworthy of record.

Harley-street, W.

### MUSCULO-SPIRAL PARALYSIS FOLLOWING INJURY; RECOVERY.

BY W. N. CLEMMY, M.R.C.S. ENG. &c.

On Jan. 20th, 1892, a seaman aged forty-one was admitted to the Bootle Borough Hospital, under the care of Dr. Forbes. The patient stated that a fortnight previously while on board ship he had been thrown against the bulwarks and received a fracture of the lower third of the right humerus. It had been set by the captain and on examination was found to be in apparently good position. While in hospital union occurred and subsequently he attended for a short time as an out-patient. Shortly before his discharge signs of musculo-spiral paralysis were noted, and this tending to become worse the galvanic current with massage was periodically applied. No improvement followed and on March 30th he was readmitted for operation. A long incision was made on the outside of the forearm and the musculo-spiral nerve exposed between the supinator longus and brachialis anticus. On tracing it upwards it was found to be invested in callus at the seat of fracture. As regards the fracture itself, the lower fragment was rotated inwards and displaced upwards and forwards, so that there was formed a recess in which the nerve was lodged and compressed. About two inches of the nerve were involved in the surrounding callus which, being somewhat soft, was gouged away and the nerve exposed and completely freed. The operation was completed by closing the wound after the insertion of a drainage tube. Four days later he had pringling over the area supplied by the nerve, in those places where previously there had been anaesthesia. Fourteen days later he complained of severe pain from the wrist to the finger ends. Power of extension of the second and third phalanges was first noticed eighteen days after the operation—it of course being very slight. To aid the extensors (by preventing the opposing action of the flexors and also the natural tendency of the hand to fall pronate), a splint was kept on the flexor aspect of the arm and hand. By the time the patient was discharged three and a half months after the operation he had but partial wrist drop, while now he has completely recovered with almost full power over his hand and forearm, shown by the fact that he has resumed his ordinary occupation as a sailor.

Bootle.

### PERFORATIONS THROUGH THE ANTERIOR PILLARS OF THE FAUCES.

BY WALTER FOWLER, M.A., M.B. CAMB., F.R.C.S. ENG.

IN THE LANCET of July 16th, 1892, Dr. Morrice quotes a previous contribution of mine in these pages (Nov. 30th, 1889) and brings forward evidence to prove that these lesions may be caused by diphtheritic ulceration as well as by scarlet fever mischief. Whether diphtheria is responsible for the majority of the perforations or whether scarlet fever occupies the premier position is immaterial to the practical side of the question, although interesting from an etiological standpoint. The object I had in view when publishing my memorandum on Nov. 30th, 1889, was to show that these perforations were no evidence *per se* of syphilis. Dr. Morrice having actually observed them in several cases, being caused by diphtheritic sloughing, corroborates my view, and his cases and remarks are exceedingly interesting and valuable. Perforations through the anterior pillars of the fauces are discovered very frequently when investigating ear complaints. At first I certainly considered them as evidences of syphilis, but being struck with the great frequency with which they were bilateral I was led to investigate their origin; hence my contribution to THE LANCET on Nov. 30th, 1889, wherein I described their clinical features. I do not for one moment wish to assert that a unilateral perforation is *not* syphilis; where one occurs careful attention should be paid to the history, and the diagnosis of syphilis should not be inferred on this one fact alone. On the other hand, a perforation through the soft palate (a subject not now under consideration) may be confidently taken *per se* as evidence of syphilis, notwith-

standing that this lesion may be very rarely caused by lupus; and also, according to Dr. Morrice, scarlet fever (which must also be rare). I may add that since my previous contribution on this subject was published I have actually seen a perforation through an anterior pillar that remained permanent, caused by the bursting of a tonsillar abscess (idiopathic); and have likewise had frequent opportunities of verifying my previous views, which I must now extend, thanks to Dr. Morrice, by the inclusion of diphtheria as one of the causes of these lesions.

## HOSPITAL PRACTICE, BRITISH AND FOREIGN.

Nulla autem est alia pro certo noscendi via, nisi quamplurimas et morborum et dissectionum historias, tum aliorum tum proprias collectas habere, et inter se comparare.—MORGAGNI *De Sed. et Caus. Morb.*, lib. iv. Proœmium.

### LONDON HOSPITAL.

PHOSPHORUS NECROSIS OF THE UPPER JAW; CHRONIC  
ABSCESS OF THE BRAIN.

(Under the care of Mr. FREDERICK TREVES.)

THERE are many circumstances which make it probable that the necrosis in this case was the result of exposure of the patient to phosphorus fumes. In the absence of other causes, a slowly extending necrosis of the upper jaw in a patient with a history such as this may safely be ascribed to the effects of the phosphorus. It is luckily unusual at the present day to meet with necrosis of the maxillæ due to this cause, the effect of Larinsér's paper on the subject in 1845, the contributions of Wilks, Bristowe, Simon and others in this country being to clearly demonstrate the cause and point out the remedy. Suppurative meningitis is rarely a cause of death in these cases, but a case is recorded which was under the care of M. Hervieux at the Hospital Necker, in which the patient, a lucifer-match maker, had necrosis of the lower jaw, the upper jaw and afterwards of the bones of the palate, the bones entering into the orbit and the frontal. He died with brain symptoms. Pus was found between the dura mater and the brain.<sup>1</sup> For the notes of this case we are indebted to Mr. H. M. Speechly, house surgeon.

A dipper in a Scotch match factory was admitted into the London Hospital on Oct. 11th, 1892. His age was forty-nine, but he had the appearance of being much older. He was thin and anxious-looking. He had worked at his trade for thirty years without suffering any inconvenience therefrom until about nine months previously to admission. The first symptom complained of was toothache in the right upper jaw, which troubled him continuously for four months. He then had some decayed teeth removed. Shortly after the gum tissue sloughed off the jaw, part of which became exposed. On May 9th some dead bone was scraped away, which gave him some relief. Gradually, however, the necrotic process spread, and a very offensive discharge, previously slight, caused him much distress during the interval between the month of May and the time of his admission into the London Hospital. For six months previously to admission he complained continually of severe headache in the frontal and occipital regions. He could bear no hard covering on his head, so he always wore a soft cloth cap. The headache was almost constant and prevented him from sleeping. His pupils were normal. On Friday, Oct. 14th, Mr. Treves operated. The sequestrum was found to include the whole of the right upper jaw, below the level of the infra-orbital foramen, and was bathed in pus of the foulest description. The cavity, after being washed out, was stuffed with iodoform gauze. The after treatment consisted in irrigating the cavity hourly with a lotion of carbolic acid (1 in 80) and the patient was placed on a liberal diet. From Oct. 11th to the 23rd the temperature was never high; it varied from 97.6° F. as the lowest

<sup>1</sup> System of Surgery, Holmes and Hulse, p. 477, vol. ii., 1883.

point to 99° 8' as the highest, being usually about 99°. Until Oct. 23rd the patient appeared to be doing well; his headache had almost gone, he slept well and was very cheerful. He was disinclined to get up, but was preparing to return home on Oct. 24th. At 3 A.M. on Oct. 23rd, eight days after the operation, on being aroused to have his mouth washed out as usual it was found that he had become unconscious. The temperature, too, had risen to 104°. On attempting to do anything for him he resisted and became very irritable and difficult to feed; he was also very restless and kept groaning and putting his hand to his head as if in pain; he vomited once some greenish mucus. Heart, lungs and abdomen showed no signs of disease; no motor or sensory paralysis; pupils contracted but equal and reacted to light.

Oct. 24th.—Patient fed by suppositories and with difficulty induced to take about a pint of milk during the night. Temperature between 99° and 100° during the night; pulse 84, full but compressible; respiration easy, equals 32; pupils normal; knee-jerks slightly exaggerated on both sides, with ankle clonus. Some twitching movements had been noticed in the left hand. Very restless; groans continually. Urine drawn off by catheter.

25th.—The patient has been more apathetic for the last twelve hours. He has taken milk by the mouth and is now passing urine and fæces under him; no vomiting; pupils contracted, equal, and respond slightly to action of light; groans continually; cheeks puff in and out with respiration, but no stertor; respiration 28 per minute and diaphragmatic; pulse full, but easily compressed, 108; skin warm; sweating freely on head and face; right palpebral fissure wider than left, the eyelids being partially closed; fundi normal, except for some enlargement of veins. The patient's condition was now desperate. On the afternoon of this date, after consultation with Dr. Stephen Mackenzie, Mr. Treves decided to trephine in the hopes of liberating any collection of pus that might have formed in the brain. By means of a two-inch trephine the skull was opened over the right motor area and a small trocar and cannula passed in several directions into the right hemisphere without result. The patient succumbed an hour after the operation.

The post-mortem examination was made on Oct. 27th by Dr. Percy Kidd. The pleura, larynx, trachea and bronchi were normal. In the upper lobe of the left lung at the lower margin was a small abscess the size of a Spanish nut with a slightly developed capsule. There were a few ill-defined reddish nodules in the posterior part of the lower lobe (broncho-pneumonic). No morbid change of any importance was discovered in any other of the viscera. Brain: Diffuse, purulent meningitis of base, less extensive over vertex. At the apex of the right temporo-sphenoidal lobe was a small encapsulated abscess, close under the cortex. It was evidently of long standing. Both lateral ventricles were filled with pus. In the right ventricle the ependyma was distinctly thickened and of a greenish-red colour. The supuration was evidently not recent. The brain tissue around the right ventricle was softened and numerous punctiform ecchymoses were seen. In the left lateral ventricle gelatinous greenish pus was found, but there was no thickening of the ependyma and the brain around was normal. The rest of the brain was healthy. The right cavernous sinus was occupied by a softening and stinking clot. On removal of the brain the foramen rotundum was found to admit a cedar pencil and to lead into a large space from which the greater part of the superior maxilla had been removed. The edges of the enlarged foramen rotundum were necrosed and greyish in colour. The parts of the superior maxilla remaining and also the body of the sphenoid were greyish and necrosed.

*Remarks by Mr. TREVES.*—The removal of the large sequestrum was effected without the least difficulty. A few taps from the chisel set it free. The patient was allowed to get up a few days after the operation, but he was rather inclined to remain in bed, stating that he had arrears of sleep to make up. There was no sickness after the operation, and he vomited only once during the whole progress of the case. He was an active-minded and intelligent man. The abscess of the brain was evidently of long standing and was due to direct extension from the seat of disease. A sudden lighting up of the inflammatory trouble brought about the fatal termination. The long period during which the abscess on the right side of the cerebrum remained dormant is illustrated by many other cases of cerebral abscess. The patient's condition at the time of the operation was desperate, and considering the liberal manner in which the trocar was used the non-evacuation of the abscess was remarkable. The pus in the abscess on the right side was very thick.

## SHEFFIELD PUBLIC HOSPITAL AND DISPENSARY.

THREE SURGICAL CASES.

(Under the care of Mr. PYE-SMITH.)

WE have frequently published in THE LANCET examples of the secondary effects of otitis media, and this case also illustrates them well. The cerebral abscess might probably have been cured had not septic phlebitis and thrombosis occurred. Perhaps this complication could have been successfully dealt with by evacuation or excising part of the lateral sinus and jugular vein; but apart from the difficulty and risk attending such an operation the patient's condition was thought not to admit of it. The case also emphasises the necessity for treating patients suffering from chronic otitis media whilst the continuance of the disease is indicated by the presence of a discharge. For the notes of these cases we are indebted to Mr. G. Wilkinson, house surgeon.

*CASE 1. Cerebral abscess secondary to purulent otorrhœa; drainage of abscess; thrombosis of lateral sinus; pyæmia; death.*—A child aged ten years was sent to the hospital by Mr. W. W. Banham on April 20th, 1892, with cerebral symptoms secondary to otorrhœa. The history was that for eighteen months the patient had had discharge from the left ear, with deafness. The discharge had occasionally ceased for a time, when the deafness had become worse, but she had not complained of headache. She is supposed to have had measles two years ago, but was not seen by a medical man. There is no history of a blow on the head or ear. On April 17th she began to complain of headache, which gradually increased in intensity and was not localised. Vomiting came on shortly after, the patient ejecting everything she took. There were no convulsions. On the 18th she was seen by Mr. Banham, and immediate removal to the hospital was advised. As she seemed somewhat better on the 19th her parents delayed to send her. On the 20th the headache was again severe, so she was sent in. After admission she complained of no further headache, nor did she vomit. She seemed, however, nervous and irritable, constantly crying to go home and being very backward to answer questions. There was a purulent, offensive discharge from the left ear, no tenderness or œdema over the mastoid process or below it, or over any part of the skull. In the meatus were some prominent granulating discharging pus. She declared herself unable to hear the ticking of a watch held close to the ear on the left side, though she could on the right. Examination of the optic discs showed slight fullness of the veins but nothing more. The temperature rose to 101° on the 21st. On the 22nd she seemed to be going on well and took food well, but about half-past five in the evening, without premonitory symptoms, she was seized with convulsions. There seems at first to have been drawing up of the right arm and turning the head to the right side. Then clonic spasms succeeded. When seen by the house surgeon about three minutes after the commencement of the fit the patient was lying on her back, the head being turned to the right, the eyes to the left and upwards. There were clonic spasms of the face, eyes and neck and all the limbs, the left side being most affected. In a few seconds the spasms became more violent on the right side. The breathing was short and jerky and the pulse very rapid. The fits continued for about ten minutes without intermission, after which the child remained comatose, the face cyanosed, the breathing jerky, with long intervals and somewhat stertorous. She perspired profusely. Other spasms of short duration succeeded. There was some hæmorrhage from the left ear. The temperature rose to 102.4°. At 9.30 she was seen by Dr. Burgess in consultation with Mr. Pye-Smith, and immediate operation was advised. At 10 p.m. the operation was commenced without an anæsthetic, the patient being comatose. There was slight conjunctival but no pupil reflex. The point selected for the trephining was an inch and a half behind and an inch and three-quarters above the left auditory meatus. A flap was raised from the bone around this point and a three-quarter inch trephine applied. The skull was exceedingly thin. When the bone had been raised the dura mater was incised and there was some troublesome hæmorrhage from one of the pial vessels. The brain bulged. A trocar and cannula were thrust downwards, forwards and somewhat inwards towards the roof of the tympanum. At the first thrust pus was struck two inches below the surface; about three drops only were obtained; it was very fetid. A larger cannula and

trocars were now used, but no more pus was obtained. A track was next made in the brain tissue with a small Volkmann's spoon in the direction of the cannula, but no more pus was found. A small-sized rubber drainage-tube was put in and brought out through a hole in the flap, which was then replaced and sutured. The mastoid antrum was next sought for immediately behind the upper half of the auditory meatus. A chisel (three-sixteenth of an inch) and a gouge were used for removing the bone. The wall of the lateral sinus was exposed posteriorly, but as far as could be judged the sinus was free from thrombosis. Finally, the mastoid antrum was opened by working in a forward direction and a communication with the middle ear established. No pus was evacuated. A small rubber drainage-tube was passed through the wound into the middle ear. Some granulations on the posterior wall of the auditory meatus were scraped and dead bone found below them, which was scraped away as far as possible. Both wounds were now dressed with iodoform, alembroth gauze and sublimate wool, a piece of gutta-percha tissue being placed over the upper dressing to keep the two separate as far as possible. The operation lasted about two hours. The patient stood it well and partially regained consciousness. She evidently felt the second skin incision. The pulse after the operation was 150 and the temperature normal. She passed a fair night, lying quite passive unless disturbed. The temperature rose to 101.8 during the night but was normal in the morning, when the pulse was 128.

April 23rd.—She takes small quantities of milk well. She cannot be got to answer questions, but cries out when the head is being dressed or when she is moved. On the first dressing there was a small quantity of serous fluid from the auditory meatus, distinctly offensive. No purulent discharge from either of the tubes. Later in the day she became very restless, pulling at the bandages and calling "Mother" and "Oh, dear!" Twenty grains of bromide of potassium were given and ten grains ordered every four hours. An ice-bag was applied over the dressing and the hands tied. She continued in much the same condition till the afternoon of the 24th, when she became more conscious and recognised her father. The improvement continued until the 25th when she could apparently understand what was said to her. Temperature 100° in the evening, pulse 120. On the 26th the temperature rose to 101° and some pus came from under the flap over the trephine wound; none from the tube in the brain. She seemed more apathetic. This condition became more marked every succeeding day. On the 28th the discharge from the ear had become copious and very offensive. Tenderness and puffy swelling were now observed below the mastoid process with some hardness in the line of the internal jugular vein. Her condition was, however, considered to be too critical for further operation. The head was much retracted and kept turned to the left, the muscles of the neck and back rigid, the tongue and lips dry, the teeth covered with sordes and the complexion dusky. No dulness or physical signs of disease was found in the chest.

On May 1st a considerable quantity of greyish, very offensive pus came from around the tube in the brain, after which the patient seemed to rouse herself for a short time from the semi-comatose condition in which she was. She opened her eyes and seemed to take some notice of what was going on. The temperature fell from 103° to 99°. It rose, however, on the 2nd to 103.2° and finally to 105°, the patient dying in a comatose condition in the afternoon.

*Necropsy.*—An abscess cavity about the size of a hazel nut was found in the brain substance just above the roof of the tympanum. The membranes were adherent to the bone at this spot, and there was some inflammation around. The purulent track through which the drainage-tube had passed led down to this, but had evidently failed to drain it. There was a septic thrombus in the left lateral sinus, extending some distance down the internal jugular vein. In both lungs were found a large number of small, recent pyemic abscesses, though there were none in the other viscera. There was no fluid in the chest.

This was probably a case of the usual ilco-cæcal variety of intussusception. It is of interest as showing that distension of the lower bowel by water may succeed when that by air fails. If a tube and funnel be used, as in this case, there would seem to be less danger of rupturing the bowel by water (unless the funnel be held very high) than there is by air, which must always be injected with considerable force, and the entrance and exit of which cannot be so easily regulated.

CASE 2. *Intussusception reduced by water.*—A male infant

aged seven months was brought to the hospital about 6 P.M. on April 21st. He was a robust, well-nourished child, quite healthy up to the onset of the present attack. The history was that about 3 P.M. the child had apparently been seized with great pain in the body, had begun to scream and toss itself about, kicking his legs and doubling up his body. Any pressure on the body seemed to increase the pain. He had been sick repeatedly, but there had been no action of the bowels or tenesmus. On inquiring it was found that the bowels had been opened about twice daily, and on the morning of the 21st had been opened twice. The patient had been fed entirely at the breast, but about 1 P.M. on the day of admission had had a small piece of pudding (boiled dough and treacle) given to him by his sister. On examining the abdomen it was thought that there was a tumour on the right side, but the muscles were so rigid and the child so restless that it could not be made out for certain. Nothing was felt per rectum. At 8 P.M. the child was seen by Mr. Pye-Smith in the absence of Mr. Thorpe. He was then quiet and the abdomen flaccid and not distended. A distinct sausage-shaped tumour could be made out lying across the abdomen above the umbilicus. With the finger in the rectum the left extremity of this could be felt through the bowel wall, feeling like the dimpled end of an intussusception. 9 P.M.: Ether was given and abdominal taxis was tried for about ten minutes without effect. Air was next injected through a valveless Higginson syringe, which was clamped by the fingers alternately on the distal and on the proximal side. The tumour was decidedly lessened, but was not quite reduced. A second inflation was made after a while, but the tumour did not entirely disappear. 9.40 P.M.: As the tumour was still felt, a normal saline solution was made to flow into the rectum through a tube attached to a funnel held three feet above the bed. About a pint and a half was thus introduced, and the abdomen became much distended. On removal of the tube much of the fluid escaped. About twenty minutes were occupied in this proceeding, after which no distinct tumour could be felt. Half a drop of laudanum was administered, to be repeated every hour unless the pupils became contracted. The child had no further symptoms. He was fed per rectum and kept under the influence of opium for two days, after which time he was again fed at the breast and made an uninterrupted recovery. On the 24th the bowels were opened, the evacuation containing blood and mucus. On the 27th they were opened freely without blood or mucus. The patient was discharged on May 6th, quite well.

The association of the symptoms, deafness, tinnitus, vertigo, vomiting and forcible falling movements towards the affected side are familiar as occurring in paroxysmal attacks in Ménière's disease, and would suggest the conclusion that the part injured by the fall was the same as that affected in that disease. The site of the lesion in Ménière's disease is, however, a matter of dispute. The blow over the mastoid process might readily cause damage to the internal ear and semicircular canals, which Knapp and other writers believe to be affected in Ménière's disease. Had a hemorrhage occurred into these parts the symptoms could scarcely have been so transient. In view of the paroxysmal nature of the attacks in Ménière's disease, Dr. Wilks believes the primary seat of the disturbance to be in the brain, affecting chiefly the auditory and probably contiguous "equilibrium centre." If in this case we are to refer the injury to the brain, one would expect the concussion to be transmitted mostly to the temporo-sphenoidal lobe and cerebellum. The temporo-sphenoidal lobe is supposed to contain the auditory and "equilibrium centre," and an injury to the cerebellum would account for "forced movements" towards the same side, nystagmus and frequent vomiting.

CASE 3. *Head injury, with unusual symptoms.*—A child aged eight was brought to the hospital on the night of Sept. 7th with a history that she had been pushed down by another girl, and had struck her head on the pavement. She had not lost consciousness, but seemed dazed for a short while. On raising her the mother found the child could not walk. On questioning her she complained of pain in the left side of the head and of feeling dizzy and dazed. On examining the head a bruise was found over the left mastoid process and zygoma. There was incessant and somewhat violent nystagmus in a lateral direction, which increased when she was told to look at the finger or to follow the finger with her eyes. The movements were most marked when she was looking towards her right and upwards. There was also slight convergent squint. The mother said she had noticed the eyes working at times before the accident.

She was asked to sit up, but appeared to be unable to do so. When supported in a sitting position the body was forcibly bent over towards the left side; when unsupported she fell forcibly towards the same side. She was put to bed and kept quiet for an hour, after which she seemed to have got over the dazed feeling—in fact, she seemed a very intelligent child and readily answered the questions put to her. She complained of a noise in the left ear like the ringing of a bell; both ears were rather deaf; the ticking of a watch could only be heard within a distance of four inches, but readily when placed over either mastoid process; she said she had had a discharge from the right ear from time to time; there was no sign of paralysis of sensation or motion in any part, nor was there loss of coördination, the patient being able to place the forefinger on the tip of the nose or heel or opposite the great toe when the eyes were closed without hesitation; the knee-jerks and superficial reflexes were normal. During the first hour she vomited three times. The optic discs appeared normal and the temperature was normal.

Sept. 8th.—She vomited once in the night and once this morning. She still leans to the left in the sitting position and falls when unsupported, though less forcibly. The nystagmus and tinnitus are less. The temperature is normal.

9th.—She has vomited three times since the last note. She can now sit and stand fairly steadily. The nystagmus and tinnitus are diminishing.

13th.—The vomiting has continued from time to time till to-day. There are still slight nystagmus and tinnitus, but no vertigo or convergent strabismus.

Oct. 4th.—There has been no vomiting since Sept. 13th; there is slight nystagmus on slight lateral movement of the eyes; there is no tinnitus, vertigo or unsteadiness in standing with the eyes open; when the eyes are closed she sways a little; there are slight choreiform movements of the arms and head.

17th.—She can now hear the watch at three feet from the left ear, but only one foot from the right ear. There is still slight nystagmus and choreiform movements.

Nov. 3rd.—The nystagmus has now disappeared; the only symptoms are the choreiform movements; the optic discs are normal. The child was discharged to-day.

## Medical Societies.

### OBSTETRICAL SOCIETY OF LONDON.

#### *Sugar in the Urine during the Puerperal State.*

A MEETING was held on the 7th inst., Dr. J. Watt Black, President, in the chair.

Drs. FREDK. J. McCANN and WILLIAM ALDREN TURNER communicated a paper on the Occurrence of Sugar in the Urine during the Puerperal State. They having investigated a series of 100 cases arrived at the following conclusions: 1. That sugar is present in the urine of women during lactation. They assume with Hofmeister that this sugar is milk sugar. Glucose may also be found. 2. That sugar is present at some period in every case. 3. That in the majority of cases the largest amount occurs on the fourth and fifth days of the puerperium. 4. That the quantity depends on (a) the condition of the breasts; (b) the quantity and quality of the milk; (c) the suckling of the child. Of 100 cases the average quantity found was 0.35 per cent.—i.e., one grain and a half per ounce. 5. That when lactation is diminished or suppressed the amount of sugar diminishes or disappears. 6. That when the production and exhaustion of the milk are equal the amount of sugar is very small.

Dr. A. ROUTH asked if any of the cases had been followed so as to ascertain whether the glycosuria persisted.

Dr. BOXALL mentioned the case of a suckling woman who was admitted into University College Hospital for repair of a ruptured perineum and whose urine was loaded with sugar. The operation was postponed for a week or two, when the sugar had disappeared. When resident at the General Lying-in Hospital his observations as regarded the presence of sugar in the urine of lying-in women completely coincided with the conclusions stated in the paper.

Dr. HORROCKS pointed out that the paper was on a physiological and not a pathological subject. The cases were not diabetic and in none of them, therefore, was there any reason for hesitating to perform any operation required. In true diabetes the fear of operation might induce coma, but other-

wise he knew of no reason for not operating upon diabetic patients.

Dr. WHEATON agreed in the main with the results arrived at, but he did not think sugar was so frequently present as stated in the paper. Normal urine always contained a small amount of copper-reducing substances. In the cases where only 0.17 per cent. of sugar was found he thought the reduction of the copper was probably due to the excess of uric acid and urates generally present in the early part of the lactation period. Drs. McCann and Turner had not shown that the sugar present was really lactose and he asked if they had found any test to distinguish between it and dextrose or diabetic sugar. It seemed a most unusual thing that the secretion of a gland should be reabsorbed, and it would be important to ascertain whether the sugar existed in the blood during lactation. He had found that where a considerable amount of sugar existed in the urine of the mother it was present also in that of the infant, suggesting that the sugar was incapable of assimilation and was of a more or less poisonous nature, and that its presence in excess might be injurious to the child. He thought the sugar in the urine of pregnant women might be due to congestion of the liver, which was present, or to a ferment in the mother's blood producing a similar effect by the decomposition of glycogen.

Dr. CULLINGWORTH suggested an alteration in the heading of the last column of the main table and this was at once accepted by Drs. McCann and Turner.

Dr. LEWERS asked whether, in addition to Fehling's test, that by potash and the specific gravity had been noted.

Dr. GRIFFITH thought the probable explanation of the presence of sugar in urine of nursing women was that it is a resorption process from the mammary glands, varying in quantity with the activity of the secretion and the difficulty with which the breasts were emptied, and, as had been suggested, possibly with the composition of the milk.

In reply, Dr. McCann thanked the Fellows for the reception given to the paper. The observations were made on 100 cases and over 1400 samples of urine tested. They had followed strictly the method of testing with Fehling's solution advocated by Sir W. Roberts—viz., (1) avoid prolonged boiling; (2) allow suspected urine to stand twenty-four hours before deciding that it does not contain sugar; (3) do not add excess of urine. Dr. McCann pointed out the importance of distinguishing between glycosuria and diabetes. Glycosuria without constitutional symptoms is of little importance. Unfortunately the cases could not be traced, as lactation is stopped when the patients leave the hospital. The only method of distinguishing between glucose and lactose is by the polariscope, and where much sugar is present in the urine, probably accompanied by a large amount of lactose in the milk, the nutritive value of the milk is diminished. Various tests had been employed; the quantitative estimation was made with Pavy's solution. He pointed out the many important points still requiring elucidation, such as the composition of the milk, its nutritive value and the condition of the blood during lactation.

Dr. GRIFFITH communicated notes of a case of galactorrhœa occurring during a first pregnancy in a patient under the care of Dr. Fentem of Bakewell. The excessive flow of milk (which amounted to a pint daily) continued during the whole period of gestation, and the treatment, which consisted in the administration of iron and quinine with pilocarpine and in firmly bandaging the breasts, was apparently without material benefit.

The following specimens were shown:—

Dr. HORROCKS: (1) Long forceps, (2) Uterine Sound, (3) Saline Transfusion Apparatus.

Dr. RASON: Woman, subject of Osteomalacia, cured by Excision of the Ovaries.

Dr. LEWERS: Papilloma on Peritoneal Aspect of Ovarian Cyst without other Peritoneal Infection.

Dr. A. ROUTH: Deformed Fœtus.

Dr. BOXALL: Placenta Prævia of unusual size and shape.

### HUNTERIAN SOCIETY.

#### *Influence of Protozoa in certain Diseased Conditions.*

A MEETING was held on Wednesday, Dec. 14th, F. GORDON BROWN, M.R.C.S., President, in the chair.

Dr. JAMES GALLOWAY made a communication to the Society respecting the above. The general term "Protozoa" was preferred as certain of the parasitic forms were of doubtful classification. The well-known psorospermic disease of young

rabbits was taken as the basis, and the main symptoms of this affection described, as observed in the young and in the adult animal, including, as easily recognised signs, emaciation, severe illness and acute enteritis. The main stages in the development of the parasite (*Coccidium oviforme*, Leuckart) were then described. The lesions caused by it in the liver and in the intestine were referred to in detail, and the importance of the condition as giving an example of the infection of epithelial cells by a parasite which undergoes one stage of its development within the epithelial cell, was emphasised. The method by which the parasite gains access to the cell was suggested to be by movements on the part of the invading organism, either alone or possibly aided by movements on the part of the epithelial cell itself. The stage of development undergone external to the body was said to be of great importance in reference to the infectious rather than contagious character of the disease. The close resemblance of the growths observed in the organs of the host to adenomatous tumours was shown. Coccidial infection in the human subject was alluded to. The question of protozoa occurring as parasites in malignant tumours in the human subject was then considered, and many forms of epithelial cell inclusions which had been described as parasites were noted, and arranged roughly as follows:—1. The invagination of one epithelial cell within another. 2. The occurrence of invading leucocytes within epithelial cells. 3. The endogenous formation of cells, possibly by direct division of the nucleus without division of the cell body, or more probably by asymmetrical karyomitosis of the cell nucleus, giving rise to several masses of chromatin bodies within one cell wall. 4. The various forms of degeneration of the cell body or its nucleus, such as the colloid &c. Many of the so-called parasites were caused by one or other of these processes. Certain other cell inclusions had been described by some observers abroad and by Dr. Ruffer and Mr. Walker in this country. Dr. Galloway was able to confirm in almost every particular the appearances described by these authors. The occurrence of the inclusions within the cell body, occasionally also within the nucleus itself; the structure of the inclusions, consisting in the adult condition of a very distinct capsule, enclosing one or more very obvious, brightly staining bodies; the radial striations passing from the periphery towards the centre; the variations in size indicating various stages of growth; the completely distinct staining reactions shown by the inclusions when compared with the nuclear chromatin of the epithelial cells and its degeneration products, were mentioned as clearly differentiating these bodies from any form of cell degeneration and guiding to the conclusion that, in our present state of knowledge, these inclusions must be regarded as parasitic protozoa, probably having very distinct effects on the epithelial cell growth and possibly even on the causation of the malignant tumours in which they have been found. The importance of careful histological methods was strongly emphasised and the cause of many of the doubtful accounts of "cancer parasites" was ascribed to imperfect methods of preparation. The demonstration was illustrated by drawings, by the use of the lantern and by microscopic preparations.

Dr. RUFFER expressed his entire agreement with Dr. Galloway's conclusions, and added some account of his investigations into the development of the parasites. Contrary to his first belief he could now with more perfect methods see the intranuclear form of the parasites in every specimen of cancer he examined. It first appeared as a little round body staining by hæmatoxylin, which approached the periphery of the nucleus and then escaped and lay free in the protoplasm of the cell. There might be one or many of these bodies and in some cases the nucleus actually burst. He knew of nothing in human pathology which would correspond to this unless it were a parasite. He had been able to see the living parasite in fresh juice scraped from a rapidly growing cancer of the breast placed in normal physiological fluid on the stage. It looked just like an amœba enclosed in a capsule, putting out pseudopodia to the periphery and withdrawing them. As to the part these bodies played in cancer he could only say that there was no reason against the supposition that some of them might be the actual cause of cancer. A nucleus containing the parasite was hardly ever to be seen dividing, but where cells were dividing the parasite was found in the neighbourhood. His suggestion was that the bodies produced karyokinesis in the cells around and thus caused the cancer growth.

#### *Fibroid Degeneration.*

Dr. ARNOLD CHAPLIN showed specimens of Fibroid Indu-

ration of the Lungs. The patient was a woman aged forty-one years who had suffered from cough for many years with little emaciation. At the necropsy the upper lobes of both lungs were found densely invaded by fibroid growth without much thickening of the pleuræ; there were some small, smooth-walled cavities in the right lung and masses of calcified and caseous material in the bronchial glands. The kidneys and liver showed evidence of chronic fibroid change. Dr. Chaplin submitted the case as an instance of general fibroid degeneration due to a fibroid diathesis and distinguished clinically by its onset after acute lung disease, by its slow apyrexial course and the absence of tubercle bacilli. An acute deposition of tubercle may occur near the close.

## PROVINCIAL MEDICAL SOCIETIES.

**BRADFORD MEDICO-CHIRURGICAL SOCIETY.**—At the meeting of this Society, held on Dec. 6th, Dr. J. H. Bell, President, in the chair, Dr. MAJOR showed a boy aged fifteen whose father had died a short time since of general paralysis, whilst the mother was mentally defective, suffered from slurring speech and probably was on the verge of the same disease. The boy himself was formerly bright and intelligent and a good singer. He first came under observation in February last for choreiform movements, attacks of headache and vomiting. He was treated with arsenic and improved. Later stammering came on, with tremors of the tongue and lips and liability to fall in walking. Mental impairment has developed, but is not very considerable; it is chiefly loss of memory and a silly expression. No hallucinations, optic neuritis, nystagmus or visual defects. The case is reported on account of the youth of the patient. Cases at seventeen and sixteen have been reported in this country and one of fourteen on the Continent.—Dr. RABAGLIATI showed specimens of Ovarian Sarcoma, he had recently removed. The first patient, aged forty-one, had noticed a movable tumour like an egg. On operation ten and a half pints of ascitic fluid escaped and an egg-shaped tumour, weighing four pounds and a half, was removed. Histologically it was a spindle-celled sarcoma with some myxomatous degeneration.—Dr. MAJOR also showed a specimen of an old Hydatid Tumour of the Liver from a man aged sixty-six. The right lobe of the liver contained a tumour the contents of which formed a faecal-like mass in which no hooklets could be found, but microscopic examination revealed the characteristic laminated membrane of hydatid cyst.—Dr. KERR spoke of the Hypnotic and Hysterical Conditions as similar, and although hypnotic treatment could not cure disease yet it was sometimes the only means available for removing symptoms. The knee-jerk is exaggerated if a patient is directed to concentrate all his voluntary power in one direction—as tightly closing eyes, clenching the jaws or fists. It is said that the tonic control exercised by the cerebral cortex on the lower centres is thereby decreased. In the case of an epileptic aura referred to a limb a tight ligature is applied, and in some cases the stimulus is said to act on the cortical centres affected and avert the threatening discharge. In hypnotising the cerebral balance is disturbed; all the cortical effort, as it were, is turned in one direction and self-control is abolished, the patient's nervous system becoming a complicated mechanism of reflexes. In conclusion, the speaker demonstrated the various hypnotic and post-hypnotic phenomena produced by suggestion.—Drs. GOYDER and RABAGLIATI joined in the discussion, which was adjourned for a month.

**LIVERPOOL MEDICAL INSTITUTION.**—A new and successful departure was adopted at the Medical Institution by devoting the whole of an evening to the study of clinical cases. The upper suite of rooms was thrown open, and screens were placed between the patients. Over sixty cases were shown, including those of medical, surgical, eye, ear and skin diseases. Eighty members of the institution were present, a number of country members and visitors availing themselves of the opportunity of seeing the more interesting cases at the time in the Liverpool hospitals. A discussion on some of the more important cases terminated the proceedings. Messrs. Barraud's portrait of the Members and Associates of the Liverpool Medical Institution was hung upon the walls for the first time. For the success of this original idea the members are indebted to the indefatigable secretary of the ordinary meetings, Dr. George G. Hamilton, who was warmly congratulated by many members on the results, and a hope was expressed that the successful experiment would be repeated.

**MANCHESTER MEDICAL SOCIETY.**—At a meeting of this Society, held on Dec. 7th, Mr. A. W. Stocks presided.—Dr. REYNOLDS showed a case of Male Hysteria in a patient aged sixty-six who exhibited very markedly the trepidant variety of the so-called symptom—complex “astasia-abasia.” He pointed out that this was probably no new symptom, but merely a new name for the well-known difficulties of walking and standing as met with in hysterical and neurasthenic patients. The patient also had other hysterical symptoms, as retraction of the field of vision, irregular patches of anaesthesia &c. Dr. Reynolds also showed (1) a case of Hereditary Chorea coming on about the age of six, the patient's father having suffered from adult chorea; (2) a case of Bilateral Chorea following an attack of slight right-sided hemiplegia in a male adult; and (3) a well-marked case of Hysterical Chorea in a girl who also had hemianesthesia.—Dr. EDGE mentioned a case of Aortic Regurgitation, in which a presystolic murmur had been frequently heard, and expressed the opinion that it would prove to be one of the cases first described by the late Dr. Flint, in which after death no mitral lesion could be discovered. Dr. Edge also mentioned a case of Mitral Stenosis, in which the presystolic murmur was unusually well conducted to the left and could be heard at the back. A loud rough murmur was also heard in this case over the pulmonary area. After excluding other causes this murmur was considered to belong to the group described by Quincke, in which, owing to retraction of the left lung, the pulmonary artery comes in contact with and is thus flattened against the parietes at each systole and a murmur produced. Allusion was also made to Dr. Bramwell's opinion that this murmur is exocardial and caused by the pericardium covering the root of the pulmonary artery being roughened by a deposit of lymph and rubbing against the chest wall.—Dr. T. HARRIS related the result of a number of post-mortem examinations in cases of Mitral Stenosis and Cardiac Dilatation, which showed that in the cases where the deep cardiac dulness extended as high as the second left interspace it was due to the enlargement of the conus arteriosus of the right ventricle and that the left auricle in the cases which he had observed was either not seen at all from the front or only the tip of its appendix was visible. Dr. Harris also referred to the difficulty which such cases sometimes presented in diagnosis, as the dulness resembled closely that caused by pericardial effusion.—Dr. LEBCH showed a case of Mediastino-pericarditis. The boy came under observation in August, 1890, and at this time had bronchitis, greatly enlarged liver, ascites and anasarca, and a slight cyanotic condition. There was well-marked pulsus paradoxus. The jugular veins were distended, but did not increase in size during inspiration. There was slight increase of cardiac dulness, but no evidence of valvular disease. Save for the disappearance of dropsy the boy has continued in much the same state since 1890, but increasing emphysema has rendered the area of dulness in the cardiac region less marked. At the present time pulsus paradoxus is not so well marked as formerly. The respiration is markedly abdominal, and during inspiration the heart beat can be felt very distinctly in the 6th space as if it were dragged down by the diaphragm, whilst in expiration the heart in this space is almost absent.

**MANCHESTER PATHOLOGICAL SOCIETY.**—At a meeting of this Society, held at the Owens College on Dec. 14th, Dr. Judson S. Bury, President, in the chair, Mr. F. H. W. COTTAM exhibited a Skull showing an aperture through the bone two inches and a half long and seven-eighths of an inch broad, situated in the upper frontal region close to the mid-line. The patient had been an inmate of the County Asylum, Prestwich, and had inflicted the above injury on himself with a carpenter's axe. Death occurred twenty-four days later after the formation of a cerebral abscess.—Dr. THOMAS HARRIS showed specimens from two cases of Primary Malignant Disease of the Pleura. Microscopically the one growth presented the character of a squamous cell epithelioma. The other was of a cylinder cell type. Dr. Harris referred to the rarity of such cases and to the subject of the development of neoplasms of the cancer type in tissues which, like the pleura, are developed from the mesoblastic layer of the embryo. Although he felt that recent embryological researches and also much of our pathological knowledge might be against the view of primary epithelial malignant tumours arising in tissues developed from the mesoblast, he nevertheless held that occasionally, though certainly rarely, such tissues did give rise to such growths.—Mr. J. W. SMITH showed the preparation from a case in which Suffocation had resulted from Ulceration of a Sup-

purating Bronchial Gland into the right bronchus. The patient a girl of three, who was supposed to be choking from a piece of toffee, was brought to the Manchester Royal Infirmary in a moribund condition. Tracheotomy and artificial respiration were performed without success. At the necropsy an oval ulcer with ragged edges was found on the outer and posterior wall of the right bronchus. It communicated with the cavity of a caseous bronchial gland. A flocculent slough the size of a horse-bean lay at the bifurcation of the trachea. Caseous nodules were scattered through both lungs.—Finally Dr. R. T. WILLIAMSON exhibited and described sections of the cord in a case of Acute Myelitis simulating Hæmatomyelia. On the day of the onset of the symptoms the patient got up apparently quite well, but while drawing up the window blinds found herself suddenly unable to use her arms. An hour later both legs became paralysed. Then followed paralysis of intercostals, bladder and rectal symptoms, analgesia and thermo-anaesthesia on the left side below the seventh rib and hyperæsthesia on the right side. Death occurred in forty-two days. Examination of the cord revealed myelitis affecting chiefly the grey matter of the lower cervical and upper dorsal regions. The left posterior horns were much more affected than the right. There was no evidence of hæmorrhage at any part.

**MIDLAND MEDICAL SOCIETY.**—At the second ordinary meeting of this Society, held on Nov. 16th, Mr. Eales, President, in the chair, Dr. MARSII showed a Papilloma removed from the Larynx of a patient and the patient herself. There had been a history of some laryngeal trouble for eighteen months; never any dyspnoea or pain. On examination a small papilloma was seen on the free edge of the left vocal cord, about its centre, and a group of three or four smaller ones at the anterior commissure. They were incised with a laryngeal knife and removed with Mackenzie's forceps. The patient's voice at once returned and has remained well since. A very small papillary growth has since recurred on the anterior commissure.—Dr. SUCKLING read notes of two cases of Dropped Foot from Sciatic Neuritis. The first was a woman aged sixty-six, who had had trouble for six months, attributed to sciatica, and had lately lost the power of raising the toes. The external popliteal nerve was thickened and tender. The plantar reflex was absent on the affected side. The second case was that of a man, aged sixty, who suffered from pain in the course of his sciatic and peroneal nerves. In this case, during paroxysms of pain, all power of dorsal flexion of the foot would be absent. Dr. Suckling called attention to the great preponderance of left-sided sciatica over right-sided sciatica and suggested that a loaded rectum might possibly be a predisposing cause of the neuritis. Nearly all cases of sciatica were, in his opinion, in greater or less degree due to neuritis. He also spoke of temporary dropping of the foot after paroxysms of pain in locomotor ataxy and of dropped foot in phthisis.—Mr. JORDAN LLOYD showed a specimen of Annular Carcinoma of the Sigmoid Flexure removed by operation from a woman, sixty-two years of age, suffering from acute symptoms of intestinal obstruction. The lumen of the bowel was contracted to the size of a crow quill, but the patient had not complained of abdominal symptoms until a few days before the operation.—Mr. LLOYD also showed a life-size drawing of a Primary Multinodular Cancer of the Liver removed post mortem from the body of a woman forty-two years of age. The specimen was shown because of the enormous size of the organ, which weighed 15 lb. 12 oz.—Dr. FOXWELL showed a Heart taken from the body of a girl of seventeen, in which there was a communication between the auricles. The opening into the right auricle was some quarter of an inch in diameter; that into the left auricle very little more than one-sixteenth, and situated much higher up in the wall of the septum, so that a valvular passage existed between them, which, it seemed, must be closed, or nearly so, during the auricular systole. The pericardium was almost universally adherent; where it was not, its layers were separated by caseous material; where adherent its layers were largely infiltrated with calcareous matter, which in places was one-eighth of an inch in thickness and was very dense and continuous forming a rigid shell to the heart. The history was one of good health and strength, though always short-winded on exertion, up to the age of fourteen; since then the patient has felt increasing failure of strength with symptoms of bronchitis. No acute rheumatism or scarlet fever.—Mr. TAYLOR showed three specimens of Diseased Kidney removed by Nephrectomy: 1. A large Pyonephrosis removed by the Abdominal Method,

the patient making a good recovery. 2. A Carcinoma of the right Kidney Removed through a Lumbar Incision. Recurrence had taken place within three months. 3. A case of Hydro-nephrosis operated on successfully through the abdomen.—Mr. BARLING then read a paper on Appendicitis.

**NORTHUMBERLAND AND DURHAM MEDICAL SOCIETY.**—Dr. T. Oliver presided at this meeting on Dec. 8th. Professor BEDSON demonstrated a ready method for the Detection and Estimation of Free Hydrochloric Acid in the Contents of the Stomach. Jolles' method was based on the fact that a solution of eosin shows two absorption bands in the blue-green portion of the spectrum, which are destroyed by hydrochloric acid intensified by alkalis, but not affected by lactic, butyric, acetic or formic acid.—Mr. MORGAN showed a boy on whom the right common carotid was tied for Uncontrollable Hæmorrhage from the mouth, apparently following extraction of a tooth. The bleeding recurred after ligation, but in a much less severe form and was easily controllable by plugging the bleeding spots.—Dr. MURPHY showed a girl on whom he had sutured the tibia for ununited fracture with a good result.—Dr. HUME showed a man from whom he had removed a large Sarcomatous Kidney by anterior incision. There had been no hæmaturia, and the ureter was found to be blocked. The amount of urine both before and after operation was about normal.—Dr. PAGE showed—(1) a man aged thirty-eight, whose right kidney he had removed for Pyonophrosis. The kidney was unusually high, so that the tumour could not be felt before the abdomen was opened and the removal was more difficult than usual; (2) a boy from the synovial membrane of whose knee-joint a Growth had been dissected; (3) a man aged seventy, who had all the symptoms of Stone in the Kidney. At the operation no stone could be found and all his symptoms had returned.—Dr. PAGE showed a man whose femoral artery he had tied for Popliteal Aneurysm.—Dr. MURPHY showed a similar case in which he had tried compression of the femoral artery but had afterwards to ligature.—Mr. WILLIAMSON also showed a case in which he had ligatured.—Dr. A. E. MORISON showed specimens from three cases of Ectopic Gestation in which he had recently operated, all the patients recovering.—Dr. LIMONT showed a woman suffering from widespread Lichen Planus. On one leg there was a patch of lichen verrucosus.—Dr. HUME showed Calculi removed from three patients by supra-pubic lithotomy, and Dr. SELBY PLUMMER showed one removed in the same way.—Dr. COLBY showed a Syringe which he had used for intra-laryngeal injection of menthol. Cough and dyspnoea had been greatly relieved by the treatment.—Mr. WILLIAMSON showed a Cup of Bone removed from an excised eyeball and two specimens of Glioma of the Retina.—Dr. ROBERTSON showed some of the Modern Instruments used in throat and ear surgery.

**NOTTINGHAM MEDICO-CHIRURGICAL SOCIETY.**—At an ordinary meeting of the Society on Nov. 12th, Mr. R. C. CHICKEN, F.R.C.S., the President, read a paper on Reducible Hernia. The object of the paper was to show that the proper treatment of a recent reducible hernia was by operation and not by truss. That the treatment by truss should be reserved as a means towards radical cure in congenital hernia or as a permanent palliative remedy in the case of the infirm, sick or aged. Under the antiseptic treatment the risk to the patient was almost *nil*—much less than that entailed by wearing a truss. The actual mortality was less. It was strongly urged that the operation should be performed early and before the rings and adjacent parts were displaced, or before the contents of the sac became too large or adherent. At the conclusion of Mr. Chicken's paper a cordial vote of thanks was moved by Messrs. Boobbyer and Anderson respectively, and carried unanimously.—Mr. R. C. Chicken presided at a meeting of the Society on Dec. 12th, when the following communications were received.—Mr. ANDERSON showed a boy aged ten upon whom he had successfully operated for Double Osseous Ankylosis of the Hip. A free and fairly firm joint was secured on both sides. He also showed a man aged forty-five upon whom he had operated for Empyema with Multiple Sinuses with complete success.—Dr. HUNTER exhibited, with Dr. ELDER, the Fœtus and Membranes from a case of Tubal Pregnancy rupturing at the end of the second month, upon which the latter had performed abdominal section. Ten days had elapsed since the operation and the woman was recovering without a bad symptom.—Dr. HANDFORD showed specimens of Multiple Military Aneurysms taken from the brain of a man aged sixty, who was first attacked with Right Hemiplegia. The one-sided paralysis after a few hours' duration spread to

the other side and the man rapidly succumbed in a state of coma. The vessels at the base of the brain were separated by washing away the brain substance with a stream of water. The aneurysms were from twenty to thirty in number and from one-twenty-fifth to one-tenth of an inch in diameter.—Dr. SYKES-WARD showed a specimen of Acephalous Monster (weighing nine pounds) which he had delivered with some difficulty by turning.—Dr. WILLIAM B. RANSOM showed a Spleen some six inches in diameter, removed from a typhoid fever patient at seventeen who died in the third week. The cystic cavity was filled with bile-like fluid and its walls showed the splenic trabeculae dissected out.—Mr. ANDERSON exhibited a Uterine Fibroid weighing many pounds which was successfully removed by himself.—Dr. HUNTER then read a paper upon Myxœdema and advocated the injection of thyroid extract. After discussing the usual symptoms and course of the disease, he described several cases in which the treatment had been adopted with complete success. He laid stress upon the necessity of a slow injection of the juice.—Dr. WM. RANSOM recommended the ingestion of raw thyroid tissue. He stated that he had unsuccessfully applied the thyroid treatment to a case of exophthalmic goitre.—Dr. HANDFORD advised the slight cooking of the gland tissue and gave an account of a case of myxœdema recently under his own care, in which every other line of treatment had been tried without benefit.—Mr. WOOD of Ilkeston gave a further history of the same case.—Finally, Mr. ANDERSON read a paper on Tubercular Tendo-vaginitis. In describing tubercle in tendon sheathes, he stated that its behaviour in them was practically the same as in joints. He advocated early operation by scraping and free drainage, with antiseptic precautions.—The PRESIDENT said that the removal of tubercular tissue from surfaces to which it was adherent by scraping had been very generally attended with the best results.

**PLYMOUTH MEDICAL SOCIETY.**—On Dec. 10th the PRESIDENT (Mr. Leah) brought forward a boy aged eleven, whose legs had been amputated at the "seat of election" for Infantile Paralysis.—Mr. WOOLLCOMBE demonstrated the present condition of the right elbow of a labourer aged thirty-two, whose joint was excised two months previously by Mr. Swain for a Compound Comminuted Fracture; and the left elbow of a blacksmith aged twenty-six, whose joint was removed six months ago by the same operator for Tuberculous Disease commencing in the Olecranon. The former was flail-like, but improving; while the latter could saw and hammer and possessed a remarkable power and range of extension.—Mr. WOOLLCOMBE also showed for Mr. Swain a man aged thirty-five cured by Laparotomy of a Cyst of the lesser Peritoneal Sac, full details of which will be published as an addendum to Mr. Jordan Lloyd's cases.—Mr. FOX exhibited for Mr. Jackson a multipara aged fifty-four with marked Myxœdematous Facies of three years' duration.—Mr. A. C. RENDLE demonstrated a very typical case of Xanthelasma Palpebrarum in a woman of thirty-five, noticed for six or seven years, and accompanied by burning and itching of the lids.—Dr. LUCY showed two microscopic specimens of commencing Epithelioma of the Tongue removed from a man aged sixty-nine exhibiting early "cell-nest" formation.—Mr. R. S. THOMAS brought forward large Multilocular Dermoid of left and Dermoid of right Ovary removed from a nullipara of thirty-eight and Dermoid Cyst of Ovary from a girl aged eleven, with microscopic specimen of cyst wall showing skin, hair and sebum.—At a meeting held in the Society's library on Saturday, Nov. 26th, under the presidency of Dr. Aldridge (Plympton), Mr. WOOLLCOMBE read a paper on the Connexion in Disease between Distant Organs not known to be related in Health. Four examples were chosen as illustrating this connexion—viz.: (1) The inflammation of one or both parotid glands after injury or disease of the abdominal contents, and orchitis, urethritis and nephritis after mumps; (2) the cerebral abscess which accompanies or follows empyema when there has been no abscess of the lung; (3) the relatively much greater frequency of abscesses of the heart and kidneys after pyæmia due to acute necrosis than in pyæmia following amputation; (4) the association of certain forms of arthritis with hepatitis and jaundice. Mr. Woolcombe produced notes of 130 cases illustrating the first of these connexions, and showed that the parotitis might follow injury or disease of almost any part of the generative-urinary or alimentary tracts and that there was no connexion between the side of the abdomen affected and either parotid in particular. In his opinion the injury of branches of

the sympathetic, causing first paralysis and subsequently increased activity of the vaso-dilator fibres and a consequent largely increased blood-supply to the parotid, afforded the only rational explanation. Next 442 cases of pyæmia collected by Paget were analysed and it was shown that abscess of heart and kidneys followed in cases after acute necrosis in 61 per cent., and in cases after amputation in only 1 per cent. Mr. Woolcombe suggested that the explanation lay in the different microbes engaged, and proposed making an attempt to propagate the microbes of pyæmia following amputation on portions of the heart and kidneys of patients in whom during life they had not caused abscesses of those organs. The other subjects were alluded to briefly, and he gave it as his opinion that the cases of arthritis followed by hepatitis and urticaria were examples of rheumatic arthritis complicated by slight pericardial and endocardial changes (unnoticed), and followed by nutmeg liver, which, by upsetting digestion, gave rise to urticaria.—Drs. Aldridge and Fox and Messrs. E. Square, M. Butteel, C. Rendle, A. Rendle and Lucy, and Fleet-Surgeon Ellis, R.N., joined in the subsequent discussion.—Mr. C. RENDLE showed the Left Kidney, Uterus and Annexa removed post-mortem from a woman aged seventy-two, who some twenty years ago was seen by Sir Spencer Wells with an abdominal tumour on which he wished to operate; a year later the "tumour burst," and was discharged per vulvam (not known whether through vagina or urethra.) Only one kidney, that shown, was present, the right kidney, ureter and ureteral opening in bladder being absent. The left kidney was much hypertrophied, and contained in the medulla a red pulsatious fluid.

**SHEFFIELD MEDICO-CHIRURGICAL SOCIETY.**—A meeting of this Society was held on Dec. 8th, the President, Mr. Simeon Snell, F.R.C.S. Edin., in the chair.—Dr. ARTHUR HALL introduced a woman twenty-three years old with the remains of the hyaloid artery persisting in the left eye. In front of the disc a cloudy funnel, with a short black rod-like body on the inner side of it, extended for some distance into the vitreous. There was also a slight central opacity of the lens.—The President, Dr. Porter and Mr. Pye-Smith made remarks.—Mr. RICHARD FAVELL showed a specimen of Tubal Mole which he had removed by abdominal section. The tumour, which was about the size of a walnut and had a small central cavity, was attached to the lower wall of the right Fallopian tube. No embryo was found, but a microscopic section showed chorionic villi.—Mr. RICHARD FAVELL related a case of Missed Abortion, in which a blood mole, after being retained in the uterus for six months and a half, was expelled about the time when gestation, had it been normal, would have terminated. The patient had no hæmorrhage in the interval.—Mr. RICHARD FAVELL showed a specimen of Fibroma of Ovary which he had removed from a woman sixty-three years of age. The tumour weighed just over three pounds, and had a thin, short pedicle which was tied in one loop. The patient made a good recovery.—Mr. RICHARD FAVELL related for Mr. LAYER particulars of the removal of an Ovarian Cyst for acute axial rotation.—Mr. Coombe, Dr. Hamel and Dr. Keeling joined in the discussion on Mr. Favell's specimens and cases.—Dr. BLACK MILNE communicated a note on the Etiology of Acute Bright's Disease. He related an instance where in one house three healthy children were almost simultaneously attacked. They had not been exposed to wet or cold and careful examination and inquiry as to the possible existence of diphtheria, scarlet fever or other of the exanthemata was made with negative results. A probable source of origin was suggested in the presence of an offensive privy-midden in a small back yard near the kitchen door. In another instance where two children in one house were found suffering from acute nephritis, Dr. Milne failed to discover any cause whatever. Reference was made to a possible microbic origin.—Dr. Burgess, Dr. Porter and Mr. Pye-Smith made remarks.—Dr. MARTIN reported a case of Diarrhœa in Advanced Phthisis in which half-drachm doses of dermatol four times a day effectually stopped the diarrhœa after various astringent remedies had been tried for days without avail.—Mr. ATKIN read a paper on Flat-foot and drew attention to the fact that slight cases often remained undiagnosed, complicating and even causing more easily detectable complaints. The connexion with ingrowing toe-nail and sweating of the feet from pressure on the plantar nerves was adverted to. The want of unanimity of opinion amongst authorities as to the causation and treatment was gone into at length.—Mr. H. J. Knight and Dr. Sinclair White took part in the discussion which followed.—A meeting was held on Thursday, Nov. 24th, Mr. Simeon Snell, President, in the chair.—Mr. PYE-SMITH

showed three patients on whom he had recently performed Excision of the Tongue.—The adjourned discussion on Anæsthetics was resumed by Dr. ARTHUR J. HALL, who laid stress on: (1) The methods of preparing the patients; (2) personal idiosyncrasies in taking anæsthetics occurring in families; (3) early signs of danger—e.g., the state of the pupil, pulse or respiration. Dr. MARTIN spoke in favour of chloroform. He dwelt upon the necessity of securing the patients' confidence before beginning to administer the anæsthetic. Too heavy a dose should not be given at the outset. Slowing or irregularity of the pulse often gave an earlier warning of danger than any change in the respiration. Mr. PYE-SMITH thought it important to endeavour to answer such questions as the following: Is one anæsthetic safer than others and of general applicability? If so, which is it? How is it to be administered, and under what circumstances is it to be discarded for some other? He thought nitrous oxide the safest, but not generally applicable. Ether he regarded as safer than chloroform and of very general applicability in this country. He suggested as rules never to give chloroform when ether might be equally well used; never to give chloroform in any case without the patient's urgent wish, and when in doubt as to which to administer to give ether. Mr. Richard Favell, Mr. Charles Atkin, Dr. Rhodes, Dr. Anthony McCall, Dr. Littlejohn, Mr. Wightman, Mr. Dale James and the President joined in the discussion. Dr. Porter and Dr. Cleaver replied.

**SOCIETY OF MEDICAL OFFICERS OF HEALTH.**—At a meeting of the North-Western Branch of this Society Mr. VACHER intimated that the parent society had resolved that the memorandum of the members of the branch on the Prevention of Phthisis should be considered at one of the parent society's meetings.—Dr. ROBERTSON then read an elaborate paper on Compulsory Isolation of Certain Diseases. He said that the mortality statistics of Great Britain as well as abroad showed that an enormous number of persons died every year from preventable diseases, whilst much of the sickness and permanent damage to health escaped observation and record. Isolation was the only available means by which infectious disease might be checked. Reasonable isolation precautions could not at present be enforced and there was a necessity for the existence of compulsory powers in certain cases. He regarded scarlet fever as the type of a most important sub-group which required isolation for every case. With regard to this disease a clause in the Public Health Act of 1875 gave the medical officer of health power to enforce isolation under certain conditions, but the weakness of the clause was so great that but little use had been made of it. By isolation he did not mean compulsory removal to hospital if proper precautions could be taken at home.—In the discussion that ensued Mr. SERGEANT, medical officer of health for the county of Lancashire, said he thought it would be injudicious at the present time to ask for additional powers of compulsion, and indeed for this purpose hospital accommodation was as yet very inadequate. Other members who spoke were of opinion, on the other hand, that as far as hospital provision was available, sufficient powers of isolation already existed.

**CERTIFYING SURGEONS' ASSOCIATION.**—A meeting of the general committee of this Association was held at Manchester on Tuesday last, Mr. Hughes (Ashton) presiding, when there was a large attendance. The first annual reports—obliged to be furnished to the Home Office under the new rule—dating from Jan. 18th to Nov. 1st and giving the number of children examined and rejected, with the cause of rejection in each case, were dealt with, copies of their reports having been furnished by members of the Association to the hon. secretary Dr. Holmes. The rejections in several large districts—chiefly in Lancashire—ranged from 3 to 4 per cent. Taking the returns as a whole, however, the chairman expressed the opinion that there appeared to be some laxity in the certifying in some districts from which returns of rejections had been received, which were meagre in comparison with others. After some discussion it was resolved to urge the importance of the subject on surgeons in these districts. It was also decided to resume the issue of quarterly reports, giving the number and causes of rejection. The general feeling was that the retention of the surgeons had led to greater care being taken in the employment of children in a physically weak state, the number of such children presented for examination being thereby sensibly lessened. The Association was stated to be making good progress.

## Reviews and Notices of Books.

*A Treatise on Gynecology, Clinical and Operative.* By S. Pozzi, M.D., Professor in the Faculty of Medicine (Paris), Surgeon to the Lourcine-Pascal Hospital. Vol. I. The New Sydenham Society. London. 1892.

THIS translation of Professor Pozzi's work, issued by the New Sydenham Society, has the advantage of having been made from the proof-sheets of a new edition supplied to the Society by the publishers as they were ready. The handy size of the book contrasts favourably with that of the first volume of the American edition. The subjects dealt with in this volume are "Antisepsis in Gynecology," "Anæsthesia in Gynecology," "Methods of Producing Union and Arresting Hæmorrhage," "Metritis," and "Fibromata"—their medical and surgical treatment. Antisepsis is dealt with in great detail, both as it affects operations to be performed per vaginam, and abdominal operations. In both the extreme importance of rendering the hands and nails aseptic is very rightly insisted on and minute directions for the purpose are given. As regards the nails, we should, however, consider the plan of keeping them short and thoroughly brushing them with soap and water preferable to cleaning them with a pointed nail file, as here advised. Dr. Pozzi lays stress on the difficulty of disinfecting the vagina by injections. To be effectual, while the vaginal pipe is manipulated with one hand, two fingers of the other must be used so as to stretch out the folds at every part of the passage, and one finger should be passed as far as possible into the os uteri. Even then disinfection is only temporary, as germs descend from the supra-vaginal cervix. To obviate the infection from this source, we are told, requires three such injections at intervals of an hour, each consisting of a litre of 1 in 3000 sublimate solution. The author naturally draws the inference "that the uterine sound should never be passed, nor should a dilator be introduced into the uterine cavity without having previously disinfected the vagina and cervix by three injections." We are inclined to think that the passage of the sound in this country has rarely been preceded by so rigorous a disinfection, but we entirely agree with Dr. Pozzi as to the reality of the danger. Fortunately the number of cases where the use of the sound is absolutely necessary for diagnosis is a relatively small one, and there is no reason why the precautions mentioned should not be observed. It is not too much to say that the habitual use of the sound as part of an ordinary examination may be taken to indicate a want of familiarity with the bimanual method of examination. We are glad to observe that the use of Hegar's dilators is condemned "unless the cervix is already soft and dilatable." Much more space than usual is devoted to "metritis," which is evidently regarded as not unfrequently separable clinically from perimetritis, and as often being the condition causing the patient's symptoms, and consequently the one to which treatment must be directed. We are told later on, however, that salpingitis coexists most frequently with metritis, and that the diagnosis must only be metritis if the appendages seem healthy when a careful examination is made under anaesthesia. There is an excellent account of the relation of micro-organisms to metritis and particularly to puerperal metritis. Winter's researches are quoted, according to which pathogenic organisms are normally present in the vagina and cervix in half the cases, but fortunately they have for the time lost their virulence. It is argued, however, that under favourable conditions—for instance, in presence of organic débris—they may resume their activity for evil. Therefore, as regards puerperal infection, while, as here stated, no doubt the infection from without—"heterogenetic" infection—is the rule, the possibility of "autogenetic infection," arising from

pathogenic germs so often present normally in the cervix and vagina, must be remembered. These observations, at all events, would explain the two fundamental rules recognised by all obstetric authorities: the importance, first, of absolute asepsis as regards the accoucheur's hands, instruments &c., and secondly, of leaving nothing in utero—pieces of placenta, membranes or clots—that can undergo decomposition.

The author adopts a studiously moderate attitude towards disputed points—for example, in regard to the use of the electrical treatment for fibroid tumours, he says: "Even an opinion can scarcely be formed, so contradictory is the evidence." It is interesting, however, to see from a discussion of this question at the Surgical Society of Paris that "it seems that the value of this therapeutic agent has been overstated from the point of view of the diminution of the tumours in size"—a conclusion in accordance with the views of most English authorities. There is a very complete account of abdominal hysterectomy for fibroids and of the various modifications of the operation; and also a comprehensive review of the most recent statistics of those operators who have had the most experience in this direction. From this it appears that, notwithstanding great experience and the greatest operative dexterity, whether the pedicle be treated according to the intra-peritoneal or the extra-peritoneal method, the mortality of hysterectomy for fibroids still remains high, especially when we remember that the natural mortality of fibroid tumours is insignificant. We are glad to know that the remaining portion of the work is well advanced in preparation and may be expected shortly.

*Papyrus Ebers. Das älteste Buch über Heilkunde. Aus dem Aegyptischen zum erstenmal vollständig übersetzt.* Von Dr. Med. H. JOACHIM, Pract. Arzt in Berlin. (Papyrus Ebers, the Oldest Book on the Healing Art. Translated, for the first time in full, from the Egyptian by Dr. H. Joachim.) Druck und Verlag von Georg Reimer. Berlin. 1890.

YEAR by year achæological research finds its most precious treasure-trove in the great Nile Valley, the home, or more truly the hive, of primeval civilisation. To that region every art, every science, traces its first beginnings, and medicine in particular acknowledges no earlier source. From the scanty and by no means precise indications of Greek and Roman writers we had long known the priority of Egypt in the science of disease and its remedies. These indications were from time to time confirmed and supplemented by representations of medical appliances and surgical instruments on obelisks, in temples and on tombs, and these again were still further enriched or illustrated by the discovery of manuscripts dealing directly or remotely with the healing art. But the most important because the most systematic and authoritative testimony to Egypt's priority in medicine is that yielded by the Papyrus Ebers, so called from the brilliant Orientalist and romancist who was fortunate enough in the winter of 1872-73 to obtain the priceless document from a citizen of Luxor, a village representing the ancient Thebes.

Other papyri bearing on Egyptian medicine were not unknown to the learned world. There was the larger and the lesser "papyrus Brugsch" in the Berlin Museum dating from the fourteenth century (B.C.)—even yet untranslated though ably summarised by the editor after whom it is named. There was the papyrus of the British Museum, attributed to the time of the eighteenth dynasty—not yet edited even, and known to us only from a short notice of it by Mr. Samuel Birch. There were other papyri, dealing half with magic, half with medicine, in the museums of Leyden, Turin, Boulaq and Paris. But none of these can for a moment compare with the Papyrus Ebers now in the library of Leipsic University for antiquity, for wealth of subject-matter, pharmaceutical and pathological, for compendiousness and freedom from clerical inaccuracies.

Around this document quite a literature has already gathered, but till the other day our best knowledge of it was that communicated by its discoverer and editor, Georg Ebers. He had fixed its date as that of "the middle of the sixteenth century before Christ." He had identified it with the book *περι φαρμάκων* mentioned by Clemens Alexandrinus, a father of the Church, who lived under the Emperors Severus and Caracalla (193-217 A.D.), according to whom it must have been the pharmaceutical part of a medical encyclopædia consisting of five other parts. He had shown that it was no original production, but indeed a transcript from an earlier work. On all these points additional light has lately been thrown, by none more effectively than by its translator into German, Dr. Joachim, who, summing up the results of his review of Ebers' conclusions, formulates his opinion as follows: "In the Papyrus Ebers we have a kind of medical compendium or collective treatise, committed to writing, at least about the year 1550 before Christ, but belonging, in its several constituent parts, to periods of time more or less anterior to that date."

It is not, therefore, the treatise on *materia medica* merely which such able writers as Dr. Berendes in the "Pharmacie bei den alten Culturvölkern" would have us believe, nor is its interest confined to the preparation and exhibition of medicaments, as a recent commentator on the "Archéologie Médicale de l'Égypte et de la Judée" would seem to imply. Were such its chief aim and exclusive subject-matter we should expect to find it dealing with remedial agents from the purely pharmaceutical standpoint, their special virtues, their actual effects, their injurious sequelæ and such like. As Dr. Joachim observes it makes mention primarily of the ailments of special organs, particularly of the stomach and the eyes, of diseases of women and of the structure of the body; and secondarily, though in minute detail, of therapeutic appliances. Under the former aspect its reference to pathological states has peculiar interest for the medical historian who seeks to connect ancient "types of disease" with their modern equivalents—an inquiry which often results in the conclusion that the malady known to the ancients under a particular name by no means corresponds in essential features with the malady to which in modern times the same title has been given. In this connexion the reader will find Dr. Joachim's excursus on the "Chlorosis Ægyptiaca" most instructive and suggestive, concluding as he does that, under the obscure malady so designated, we must understand a disease due to the parasitic worm which in Egypt haunted the duodenum—*ankylostomum duodenale*—the pathological expression of which was that hæmatic disorder known as chlorosis—in this case the "Chlorosis Ægyptiaca."

We might follow Dr. Joachim throughout his most careful and clever introduction and give further evidence of the scientific knowledge he has brought to bear on his version of the Papyrus Ebers—knowledge which places him at a distinct advantage over its able and keen-witted discoverer; but our space will admit of only a brief reference to his work and the claims it has on the profession. It was undertaken in behoof of the busy practitioner who cherishes a natural curiosity to know the first simple rudiments of his time-honoured craft. Himself a practising physician, he yet had the mental pluck to dedicate all his spare time to mastering the Egyptian language—a task which, to "the languid students of the present day," as Hallam describes them, would of itself seem sufficient life-work. After unwearied application he made himself master of the original of the papyrus and proceeded to give its meaning, word for word, in his native German. Difficulties, neither few nor small, continually beset his progress, but these he has either surmounted or left indicated for subsequent solution by the readers whom he fondly hopes he may induce to follow in his footsteps. With

regard to his execution of the translation, we have the testimony of perhaps the greatest of living Egyptologists as to its sterling merits—the testimony of Professor Lieblein of Christiania. This attestation is all the more significant, as besides his unique knowledge of the Egyptian language and Egyptian archaeology Professor Lieblein had himself been long engaged on the Papyrus Ebers, and has strengthened Dr. Joachim *mit Rath und That* (with word and deed) on all critical occasions. The introduction, of which we have already spoken, furnishes the reader with every needed *Orientirung* (initiation) before entering on the study of the book itself, and a painstaking index completes the value of the whole. We can only echo Dr. Joachim's wish that his translation of this ancient manual of the healing art will be appreciated at its true value and stimulate an ever-increasing contingent of the profession to study that strangely neglected though most fascinating department of history—the rise and evolution of medicine.

*The Operations of Surgery.* Intended especially for the use of those recently appointed on a Hospital Staff and for those preparing for the Higher Examinations. By W. H. A. JACOBSON, M.A., M.B., M.Ch. Oxon., F.R.C.S. Second Edition, with 235 Illustrations. London: J. & A. Churchill.

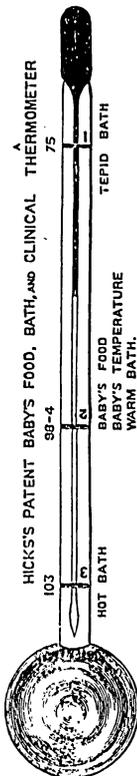

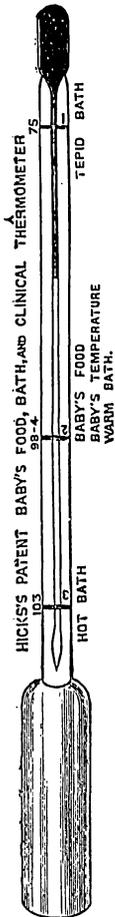

WE regret that through an oversight we have not yet noticed this the second edition of a most excellent manual. The first edition was speedily exhausted and another demanded. The plan of the book remains unaltered. There are, however, certain improvements—for instance, "the chapters on the results of Otitis Media, Brain Surgery, Extirpation of the Larynx, Inguinal Colotomy, Nephrolithotomy and Cholecystotomy have been largely rewritten; while the additions include sections on Anæsthetics, Antiseptics, Diagnosis of Renal Calculus and the conditions which simulate it, Calculus in the Ureter, Intestinal Anastomosis, Typhlitis and Appendicitis, Rupture of the Intestine, Pancreatic Cysts, Tubercular Disease of the Bladder, Prostatectomy, Erasion of the Knee and many minor ones." As we stated in our review of the first edition of the work it aims at being much more than a mere dry exposition of the various operations which are performed on the human body for the cure or relief of disease or deformity &c., and gives the indications for the performance of the operation described, shows the dangers to be feared from the operation, the results both immediate and remote to be expected and the after treatment required. The present edition is larger than its predecessor, has two to three lines to each page more than the first edition and contains more illustrations of the same useful character. The handbook is one certainly to be recommended.

## New Inventions.

### A NEW THERMOMETER.

WE have received from Mr. James Hicks of Hattor Garden, manufacturer of scientific registering instruments, a new form of thermometer suitable for use in the nursery. It is provided with a mercury bulb in the usual way and a graduated tube. At the other extremity the glass is widened out into an air chamber, one form of which is cylindrical and the other spherical. These chambers serve as floats to the instrument when taking the temperature of the bath. Among the various uses for which these thermometers are adapted is the securing of uniformity of temperature of the food of young children and the testing and regulating the heat of the child's bath. They can also be used in taking the temperature of the skin in the axilla or in mucous cavities, and will thus serve in a rough-and-ready way as a premonitory warning in cases of febrile disease. The

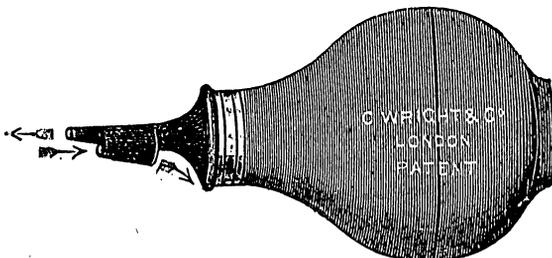

graduated tube contains but three marks—viz., one at 75°, which marks the temperature for a tepid bath; the second at 98.4°, the temperature of a child's body and the temperature to which water should be raised when a warm bath is required; the third at 103°, which marks the temperature of the water when a hot bath is required. This easy system

of marking cannot but be very useful to nurses. We have tested these thermometers against registered instruments, and find Hicks's patent to correspond with the readings of those registered instruments in all cases. These instruments are useful in every household, and their cheapness renders them easily accessible.

A NEW EAR SYRINGE.

Messrs. C. Wright and Co. of New Bond-street, have submitted to us an ear syringe for the use of patients and nurses. It is not always an easy matter to provide a syringe

which will be used effectually by unskilled persons, and at the same time it is, in certain inflammatory diseases of the ear attended with profuse discharge, most necessary that the

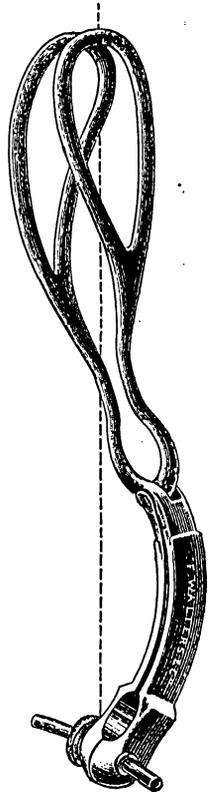

ear should be completely cleansed several times in the course of the day. This syringe ensures two requirements:—1st. The stream of water or other fluid passes along the roof of the canal and so the ear is thoroughly cleansed. 2nd. No injury can be done to the ear, as the nozzle is so constructed that it cannot be inserted too far. The ingenious arrangement which secures this also forms a passage for the returning stream of fluid.

A NEW BANDAGE ROLLER.

Mr. James Bellaers of Regent-street, Leicester, has submitted to us a new bandage roller, which is so constructed that it can be instantly adjusted to any width of bandage. The machine being made of metal is easily kept clean and is a distinct improvement upon many of the old bandage rollers. It is portable, light and strong, qualities which render it useful for first-aid work and nursing classes. It can be readily and securely fixed on any table.

AN IMPROVED ASEPTIC AXIS-TRACTION FORCEPS.

Messrs. Walters and Co. of Moorgate-street, E.C., have manufactured for me a new axis-traction midwifery forceps which is at once efficient, simple and cleanly. The instrument is made entirely of steel (plated) and the surface is perfectly smooth throughout, affording no nidus for the lodgment of disease germs, while the whole instrument can be plunged in boiling water or otherwise purified. The blades are of the usual shape. A Barnes' foramen is placed at the lock for use if necessary when the head is at the outlet. Beyond the lock there is a perineal curve, exactly counteracting the pelvic curve of the blades. Longitudinal handles are abandoned. At the extremity of the perineal curve (where it meets the axial line) there is a movable transverse traction rod and a second foramen (between the parts of the forceps) to receive the middle finger, thus forming a very comfortable hold for the operator. The traction rod also secures the two halves of the forceps when in position, being provided with two lateral rings, one fixed and one movable (the latter running freely by screw action), so as to embrace the extremity of the forceps. The forceps is about an inch longer than Sir J. Simpson's. This forceps, while as efficient as the usual axis-traction forceps, is less complicated and less likely to retain septic material. The fault of forceps with a perineal curve (without added tractors) has generally been that they have been provided with longitudinal (wooden) handles, ignoring the fact that traction can only be efficiently applied at one point—viz., where the perineal curve meets the axial line. To sum up, I claim for the forceps that it is (1) efficient, (2) aseptic, (3) simple in its mechanism and (4) comfortable for the operator.

Winchester.

G. TAYLOR, M.B.

MEDICAL MAGISTRATES.—Dr. Robert McPherson of Stalybridge, Mr. Henry R. Leech, L.R.C.P., L.R.C.S. Edin., of Birmingham, and Dr. Joseph Thornley of Bolton, have been added to the Commission of the Peace for the boroughs of Stalybridge, Birmingham and Bolton respectively.

# THE LANCET.

LONDON: SATURDAY, DECEMBER 24, 1892.

WITHIN a very few days two remarkable men have died—Dr. WALTER HAYLE WALSHÉ and Sir RICHARD OWEN. In our obituary column of this week we have sketched the principal features and events in the long and fruitful life of Sir RICHARD OWEN, which is full of suggestion and stimulus to those who consider it. Next week we hope to notice in some detail the life and work of Dr. WALSHÉ. Both of them illustrate the longevity of scientific men. Indeed, both of them had outlived most of their contemporaries, though happily neither of them had outlived his fame. It is gratifying to think not only that both of these great men were members of the medical profession, but that to both of them this profession was the stimulus of their genius and the basis of their enduring work. It is difficult to go back to the time when RICHARD OWEN was a medical practitioner. His name had for years dropped out of even the Medical Register. But for all that his life began with the study of anatomy and medicine in Edinburgh and he was in practice for some time in the neighbourhood of Lincoln's-inn. His genius was recognised by ABERNETHY and other members of the profession, and in the Hunterian Museum of the College of Surgeons he found the first scene and opportunity of his most useful and laborious work. Though his attitude towards the greatest anatomical conceptions of the century has been somewhat conservative; though his recognition of the doctrine of evolution has been, to say the least halting, it is impossible not to see even in his own anatomical work a large part of the foundations on which that great doctrine has been based. We can well imagine the intensity of the feeling that DARWIN confessed to Sir CHARLES LYELL when he wrote—"How curious I shall be to know what line OWEN will take: dead against us, I fear." Nevertheless it is most gratifying to read further that "he wrote me a most liberal note on the reception of my book, and said he was quite prepared to consider fairly and without prejudice my line of argument." DARWIN considered that OWEN had suggested belief in the unity of Origin of Birds, and OWEN himself made claims to having discovered the principle of Natural Selection, though DARWIN said that whether OWEN or he were first, both of them were preceded by Dr. WELLS and Mr. MATTHEW. No one can be surprised that OWEN at fifty-five years of age, as he was when the "Origin of Species" appeared, should think conservatively. What is more curious than divergence of opinion on great and novel doctrines and generalisations is the opposition of giants in science on questions of fact as in the famous scene in the British Association at Oxford when OWEN, having asserted that the brain of the gorilla presented more differences as compared with the brain of man than it did when compared with the brains of the very lowest and most problematical of the quadrumana, was answered by Mr. HUXLEY with a direct and unqualified contradiction. All these details will now be forgotten and the world will think only of OWEN'S prodigious labours and his unsurpassed knowledge

in comparative anatomy, of his genial nature and general accomplishments, of his distinguished appearance, of his enormous public services in the promotion of public health and of the successful importunity which he brought to bear on rigid economists until they yielded and gave the nation a museum of Natural History somewhat proportionate to its own wealth in money and in great anatomists, to say nothing of the greatness of the subject which it is meant to illustrate.

Of Dr. WALSHÉ, pending our biography of next week, we need only here say that he was one of the most accomplished physicians of the middle of this century. None that have ever met him will forget the charm of his courtesy as an Irish gentleman, and none that are familiar with the literature of medicine and its modern progress will fail to recognise that he was one of its most enlightened teachers and practitioners. His books are still authoritative and classical. His precision of observation, his accuracy of diagnosis, the carefulness of his anatomy, and the lucidity with which he expounded the new methods of physical diagnosis, which he had studied under LAENNEC, have been recognised by all his contemporaries, from Sir THOMAS WATSON downwards. He was a true physician in the sense of being a student of nature and of facts in the matter of disease. But he was not a mere physician. His mind was of that liberal type that could not be holden of any one pursuit; and, like other great physicians, he took pleasant excursions into the regions of philosophy and metaphysics and even of theology. One of the most recent—we believe the most recent—instances of such excursions and their results will be found in THE LANCET of Jan. 5th and 12th, 1884. It has sometimes been said that the very boldness of these excursions stood in his way and gave an impression of want of reverence for more ordinary or more orthodox views. And, in fact, it must be admitted that he did not so much care for "views" as for truth. In these very articles he estimates that the definite discovery of the relation of the left third frontal convolution to the faculty of language was worth all the speculations of all the metaphysicians in the previous centuries. But for all this, there was no want of reverence in him. And it is only to be regretted that for so many years before his death the world saw and heard so little of one who observed it so much, and who did so much to raise the standard of professional knowledge and method.

THE experience of the past autumn, whilst affording proof of the indebtedness of the country to the vigilance and labours of the health officers of a number of our principal ports, revealed also certain sources of weakness in our port-sanitary administration, and it at the same time led to a variety of demands which may be regarded as going beyond the necessities of the case. Hence it was a happy idea on the part of the Lord Mayor to invite the health officers of our ports to a conference where real needs could be emphasised and where discussion might dispose of certain demands that were unreasonable and impracticable. Amongst the latter the question of quarantine was very summarily disposed of. Dr. DAVIES of Bristol moved that the detention of vessels having no sickness on board merely because they came from infected ports was unjustifiable. This resolution was supported by Dr. MASON of Hull,

by Dr. ARMSTRONG of Newcastle and by others, and was unanimously adopted. From the public health point of view quarantine against cholera in British ports has, we trust, now received its *coup de grâce*. Other subjects discussed were of a different character. One proposal was that the Local Government Board should issue a list of infected ports; but no definition of an infected port appears to have been suggested. Herein lies the great difficulty. Is Hamburg now an infected port? The answer is both Yes and No. But which answer is to be acted on? Dr. COLLINGRIDGE, as chairman, urged that the Government could not undertake any such task, and he moved an amendment which led to the abandonment of the original proposal. But we fear the alternative of forming a committee to publish a list of such ports will not prove to be practicable, and we are convinced that if attempted it will be found to involve very great difficulties and inconsistencies. One of the greatest difficulties is indicated in the recommendation which was resolved on, to the effect that port medical officers should be armed with compulsory powers to detain vessels arriving from infected ports until released by formal certificate. England and the majority of the European Powers have recently decided that disease on board, and not the port from which a vessel sails, is to be regarded as the criterion for purposes of health. And this is the only sound method of action. How, for example, will the Southampton health officer deal with vessels arriving from Bombay? He must detain them because "all ships from infected or suspected ports should be treated as infected until found otherwise," and because Bombay port is well-nigh always infected; and yet the much-abused Egyptian Government will regard these very vessels as healthy and admit them to the free passage of the Suez Canal because no disease exists on board. We fear that, as regards some such points as these, solitary ports at home and a few European ports near at hand have alone been held in view, and we cannot but think that when the full scope of some of the proposals made comes to be appreciated several of the conclusions arrived at will not be found practicable. Bitter complaints have been made by those interested in British shipping this year because English ports have been branded as infected abroad by reason of the occurrence—indeed, the importation—of one or two cases of cholera. What will it be next year if the port sanitary authority of London or other body issues an English list of "infected ports" in Europe?

On some points excellent suggestions and proposals were made by various speakers. Thus, when it is decided that medical inspection of certain vessels is necessary, it is intolerable that the vessel should continue its journey with the inspecting health officer on board, and thus carry him many miles up a river estuary—perhaps, indeed, right into dock. The proposal that some detention should, under proper limitations, be enforced, and that proper stations should be appointed where such work has to be done, must be regarded as a proper one. The truth is that our actual experience as to what is really necessary in order to carry out our system of medical inspection has until recently been extremely limited, and we must look mainly to experienced port health officers for advice as to what is needed in order that the system may become effectual without the imposition of needless and impracticable restrictions. From

this point of view the Conference has done excellent service. It was, of course, only a consultative body; it could only advise, and it is intended that the port authorities shall themselves soon meet and put forward such conclusions as, after mature deliberation, they may deem necessary for the proper performance of their duties. One question is sure to give rise to much discussion both on their part and on the part of the Imperial Government—namely, that the cost of carrying out the cholera precautions should be borne by the Imperial Exchequer. How far this is to apply to inland authorities as well as port ones does not as yet transpire, but it must be remembered that their duties may also become onerous and costly and that they are likely to follow suit in making a similar demand.

WE dwelt recently upon the general meteorological features of the resorts most in favour as winter quarters. In the present article we will give a similar slight sketch of the subject from the point of view of therapeutics. In many cases the selection of a winter residence is a simple matter. Thus, where mere debility, anæmia, or proneness to bronchial catarrh is the motive for avoiding the British winter, the patient will probably benefit by repairing to any of the very numerous resorts where the average of sunshine, warmth and fine weather in winter is decidedly above what may be fairly expected at home. Such cases do very well on the Riviera, or at Pau or Biarritz, or at Algiers or Egypt. With regard to such patients the line cannot be drawn with any strictness, and the usual rules regarding humidity, equability of temperature &c. have no precise application. Generally, debilitated and anæmic patients require moderate stimulation; hence the decidedly sedative resorts had better be avoided. More care and discrimination will be required in advising patients who have made but an imperfect convalescence from some acute illness—such as typhoid fever, pneumonia or pleurisy, or from a surgical operation. The practitioner must, in such instances, decide whether the amount of constitutional vigour present, the degree of integrity of the digestive functions, the amount of fever (if any) point to the case requiring moderate or decided stimulation or whether soothing meteorological conditions are indicated. If pneumonia or pleurisy has become decidedly chronic and the chance of an acute recrudescence seems remote, few resorts afford such good results as the Alpine or other mountain sanatoria. Where a surgical operation has left some local mischief or constitutional dyscrasia behind, sea air is usually best, either (preferably) in the form of a sea voyage or at one of the moderately bracing marine resorts, such as Margate, Biarritz or San Remo. In the case of impaired convalescence after typhoid fever it would be well to remember that very bracing conditions may tend to light up the fever again, that a long and wearisome journey is very undesirable, and that resorts such as Madeira, where diarrhoea is very common, should be avoided.

Our next group—viz., rheumatic and renal cases—is easily disposed of. Warmth and dryness are here indicated, and the elevated sanatoria are inapplicable. Our choice will probably lie between the Riviera, Malaga, Morocco, Algeria and Egypt, and these resorts all present considerable advantages for the patients in question. If the Riviera be chosen probably Mentone or San Remo

presents the greatest advantages in these cases; if Algeria be selected the patient should spend as much of his time as possible inland rather than on the coast; and if Egypt be the choice, the region of the Delta should be avoided. Many resorts are vaunted as at once dry, warm and equable. If such really existed they would be a veritable paradise for the sufferer from chronic rheumatism or chronic nephritis. Unfortunately, such a combination is a meteorological impossibility. Wherever we find a high degree of warmth with a high degree of dryness, there by necessity we also find great differences between sun and shade temperatures and between diurnal and nocturnal temperatures. This is a point regarding which it behoves us to warn our patients. The chief means of avoiding the dangers of a warm and dry climate are the use at all times of woollen clothing, and the avoidance of exposure at and immediately after sunset. As we have hinted, rheumatic or renal cases should never be sent to the high altitudes.

The neurotic patient is always troublesome to deal with, and to suggest suitable winter quarters for him is not very easy. It is satisfactory, however, to reflect that nervous invalids often benefit by travel *quâ* travel. "Anywhere, anywhere, out of the world," says the poor victim in HOOD'S touching poem. "Anywhere, anywhere away from home" is the feeling expressed or implied in hosts of nervous cases. However, even in such instances it will not do to act at haphazard, and some approximate rules will be found helpful. Thus, neurotic cases do very badly in the mountains, the keen air being apparently too exciting for them. They do badly also at some resorts, such as Cannes or Nice, where there are too much glitter and glare, and where the exposure to the sea is too direct. On the whole, neurotic cases had better avoid both the mountains and the exposed marine resorts, and fall back upon the sedative or moderately bracing resorts, such as Pau, Arcachon, Montreux, Grasse, Pisa or Rome. Neurotic cases, especially if these be hypochondriac, do badly on shipboard, the "sad sea waves," the monotony of life and the deprivation of many social enjoyments and customary occupations tending to aggravate their melancholy.

The last class of patients wintering abroad—viz., pulmonary cases—will require rather fuller consideration. We have already said that chronic pleurisy and unresolved pneumonia, if all acute symptoms have definitely subsided, often do surprisingly well at the elevated mountain resorts—Davos, the Engadine, the Dolomites, Colorado &c. Bronchitis, either subacute or chronic, is greatly under climatic influence, and immense benefit may accrue from a well-planned winter abroad. A warm, moist and equable climate, such as that of Madeira, does best where there is much hacking cough without excessive secretion. Where bronchorrhœa exists a drier climate, such as that of Mentone or San Remo, will be found more applicable. The high altitudes are usually out of court in all forms of bronchitis, but more especially if any emphysema be present. The case of phthisis is peculiar and difficult. No known climate prevents the development of tubercle in the lung, but yet every authority admits the great benefit often resulting in this disease from climatic change. The subject is too vast and too abstruse to be more than glanced at in a leading article. Several principles are clear. Cases of chronic

phthisis, without much fever, rapid wasting, or large and progressive destruction of lung tissue, are alone applicable for climatic treatment. Early quiescent disease limited to one apex, and without much constitutional disturbance, constitutes the special case where signal advantage often accrues from well-directed climatic change. In such cases the relative merits of the sea voyage, the elevated sanatoria, the Riviera, Madeira, Algeria and Egypt must be carefully weighed, but no detailed or precise rules can be formulated. The high altitudes are contraindicated by the presence of any weakness of the circulatory apparatus, by emphysema, rheumatism or renal mischief, and by nervous irritability. There are few definite contraindications to the sea voyage except melancholia, an invincible dread of the sea and extreme proclivity to sea-sickness. The fact that the patient has had hæmoptysis, though often regarded as very important, really affords no sure help in determining the question before us. Proneness to diarrhoea or intestinal mischief would contraindicate Madeira.

Change of climate may often be sought as a means of palliation in advanced and hopeless cases of phthisis. In such instances mild, sunny and sheltered resorts will be found most advantageous.

THE discussion of what are called "hospital manners" has recently occupied the attention of more than one of our contemporaries. The phrase, according to one of these, describes the "specially rude and flippant attitude which the house surgeons, house physicians and other subordinate officials of our great hospitals are often charged with exhibiting to poor humanity which is forced to seek the aid of those great and noble institutions." It is proverbially easy to bring general and sweeping charges against any large body of men engaged in arduous, beneficent, and often, we regret to say, thankless work. That a house physician or house surgeon may occasionally be guilty of inconsiderate, or what seems to be inconsiderate, behaviour towards some of those who come under his care is possible; but that any isolated instance of such behaviour should be made the ground of a general attack on a large body of hard-working, conscientious, and, as a rule, extraordinarily patient men, is not only ungenerous but unjust. A good deal is said and written about young men "just qualified" and "puffed up with an undue sense of their own importance," and this is not stated as any mitigation of their offence. It is certainly news to us that a house physician or house surgeon, holding any of those posts which are coveted by the best of the younger men who enter our profession, is habitually in the frame of mind which such a description implies. The very fact that he has been selected for his responsible position is an indication that he has shown not only an unusual ability in dealing with disease, but also that, in the opinion of those who are brought daily in contact with him as teachers, he possesses other qualities marking him out as the most suitable man for the duties to which he aspires—duties which consist not only of medical treatment, but which also evoke and demand the power of dealing justly and considerately with suffering humanity and anxious friends and relatives. That the choice is justified in the vast majority of cases we have no doubt; that an occasional instance of inconsiderate treatment—we do not believe of patients, but of their friends—can occasionally be brought forward we cannot

regard as an indictment of the whole class. Besides, as a matter of fact, the house surgeons and house physicians at our large hospitals are often men who have held their medical qualification for some months or even years, and who have employed the interval in study and the acquisition of experience in some continental medical school or in attendance at various English hospitals; and even if they do occasionally suffer under the "grievous" disadvantage of being young men, it is a disadvantage which every day is remedying. It seems to be assumed that a young man, as soon as he receives his hospital appointment "throws his good breeding to the winds and addresses the poor mortals whose suffering he is paid to attend to and relieve, as if they belonged to an entirely inferior group of the quadruped class." The writer from whom we have quoted has certainly been unfortunate in his acquaintances among the class he is abusing. We venture to think that our experience and knowledge of that class are much more extensive and certainly more intimate than his, and although occasionally we may have met a house surgeon or house physician who does no credit to the traditions of his order, such instances are very uncommon. The sneer also with regard to the payment is singularly out of place. The well-paid house physician or house surgeon we have not had the privilege of meeting as yet. He may possibly be looming in the distance, but many of the class whom we have been fortunate enough to know at our large hospitals have not only given up their time and energy to the duties of their posts, but have actually had to pay no inconsiderable sum for that privilege—a sum so considerable as to place entirely out of the reach of many the possibility of enjoying the experience which the duties imply. This of course is a point which we do not wish to emphasise, and it would certainly be no excuse if the charges implied were found to be well grounded. Our contention is that they are not, and that rudeness and incivility are as rare among house surgeons as they are amongst the general body of medical practitioners; and we would further venture to ask whether the general public show to the junior staff at hospitals the consideration which is naturally their due? We do not excuse incivility or rudeness, far less inconsiderateness, to patients on the part of a hospital resident any more than we excuse the same behaviour in his practising colleague. In both such conduct is reprehensible and to be deplored, and in both we think it is exceptional. But the discussion, however unfortunate in tone and temper, and however great the ignorance of facts displayed may be, should serve to put house physicians and house surgeons more on their guard to carry out even more carefully those virtues of Christian charity to the practice of which they have dedicated their lives.

---

A NEW PROFESSORSHIP IN JEFFERSON MEDICAL COLLEGE.—At a meeting of the Board of Trustees held on Wednesday, Nov. 30th, Dr. G. E. de Schweinitz was, on the unanimous recommendation of the Faculty, elected Clinical Professor of Ophthalmology in the Jefferson Medical College. At the time of his election Dr. de Schweinitz was Professor of Ophthalmology in the Philadelphia Polyclinic and Lecturer on Medical Ophthalmoscopy in the University of Pennsylvania.

## Annotations.

"Ne quid nlmis."

PROFESSOR MOLESCHOTT.

WE give elsewhere an extended report of the honours conferred in the University of Rome on its septuagenarian Professor of the Institutes of Medicine. A notable man, even had he never travelled beyond his native Netherlands, Moleschott has made himself yet more notable by his singularly varied, not to say adventurous, career. He began scientific life, as we have already indicated, under the auspices of Gerard John Mulder, and the methods and the knowledge he thus early mastered fitted him for the rôle he was destined to play as a reforming physiologist in doctrine and in exposition. His career at Heidelberg is memorable in academic and scientific annals for the intrepidity with which he assailed and seriously invalidated the views of Liebig, particularly in the domain of nutrition, and after his virtually constrained withdrawal from Germany to Switzerland he continued his thoroughgoing independence of investigation and of teaching in the medical school of Zürich. His beautiful memoir on "Licht und Leben" marked him out as a physiologist equally competent in the sphere of speculation and of analysis, and the fame he acquired among the Swiss led to his transference, on the invitation of Cavour, to the then somewhat backward school of Turin. There his early and keenly sympathetic adoption of evolutionist principles brought him much enthusiastic support from the younger generation of students, while he continued to delight and conciliate the older by his lucid exposition of all that was soundest in the new biology. His pupils soon carried his spirit and methods, as well as his doctrines, to other centres of professional education, so that his fame was thoroughly established throughout Italy when some twelve years ago he was called to the chair of Physiology in Rome. Again he made his mark, in spite of much recalcitrant tradition, and year by year he sent forth to the Italian cities and provinces a thoroughly equipped band of working practitioners and hygienists. The good he thus achieved can be estimated only by those who remember the slovenly training so long the rule in Italian Universities; indeed, the reinvigoration of medicine at his hands has been quite as remarkable as the revival of archæology at those of the Germans in the same peninsula. Nothing has been more wholesome for Italy than the substitution within the last twenty years of Teutonic for Latin influences, particularly as these latter were represented by the French. Italy's Gallic neighbours were too nearly akin to herself to exert the same fresh, deeply penetrating reforms in research and in teaching as those introduced by the investigators and expositors of the Rhinlands. While France tended to confirm Italy in her worst, most traditional shortcomings, Germany infused a new life and gave a novel direction to her ideas and her work, and the fruits of her influence have been especially made conspicuous by the Dutchman as to birth, but Teuton as to experience and idiosyncrasy, James Moleschott. It was to express her gratitude for services really inestimable that Italy came forth in all her academic and scientific strength on the 16th inst., when her central school was the scene of a commemoration as brilliant and impressive as it was unique. The brotherhood of science, the intercommunion of diverse yet harmoniously inspired nationalities, the alliance, offensive and defensive, formed between them for the defeat of prejudice and the reclamation of the unexplored or waste lands of thought had no finer illustration than the reciprocity of feeling evoked between the hero of the day and his admirers—a reciprocity which Italy will exemplify on a yet more imperial scale in

the grand concourse of the profession which is to hold its triennial *festa* in Rome in the last week of September, 1893.

### ROYALTY AND THE HOSPITALS.

It is gratifying to see indications that the members of the Royal Family are beginning to resume their public functions and that hospitals are among the first institutions to be favoured with their presence. Nothing could be kinder or more congruous on their part. "A fellow-feeling makes us wondrous kind." The interest of the Royal Family in hospitals has always been great and practical, but it can well be imagined that the keen anxieties and suffering through which they have passed this year have quickened even their sympathy with institutions and with a profession which are associated with sickness and all the "lenient arts" for its mitigation. We are grateful to their Royal Highnesses the Prince of Wales, the Duke of Connaught and the Duke of York for their recent services in this direction, which we report elsewhere. Their example will stimulate the sympathy of others for hospitals, which need and deserve twice as much support as they receive. Nor are we less pleased to think that the active resumption of public functions will be the best remedy for the grief which must still deeply affect the Royal household.

### A MEDICAL MAN v. THE GOVERNMENT OF WESTERN AUSTRALIA.

It is always gratifying to us to record the vindication of an injured medical man, and the gratification is greater in proportion to the strength of his enemies and the delay in his redress. A striking case of the sort is related in several copies of the West Australian (Perth) papers. It is that of a medical man, Mr. Henry Lionel Smith of Albany, who in 1887 was acting medical officer of Albany, and in that capacity was attending a boy named Webb and two or three other patients in the old hospital there. Webb had colonial fever. The hospital had been sold to the West Australian Land Company and the purchasers of it wanted it cleared by the removal of the patients to the new hospital, a quarter of a mile distant. Mr. Smith was only waiting for furniture in the new hospital. The old hospital was surrounded by a stone wall, the stone of which was wanted by the Land Company who had bought the ground. Mr. Smith gave his consent to Mr. Castledine, clerk of works to the Land Company, for the removal of this wall on the understanding that there was to be no interference with the main building in which the three patients were in charge of an orderly. Instead of this the Land Company partly demolished a lean-to wall, thus impairing the building itself, and worse still, after Mr. Smith's visit, proceeded to remove doors. The night following was windy and wet and the boy Webb got congestion of the lungs and was so much worse as to necessitate his removal the next day to the new hospital, in which he died. He was removed with great care by Mr. Smith, assisted by Mr. Stewart. Mr. Smith certified his death to have been caused by congestion of the lungs and suggested an inquest to the resident magistrate. The first day the inquest was conducted by the police sergeant, the second day by the coroner, Mr. Bailey, who was also manager of the Union Bank. The jury consisted of three persons—all which arrangements seem to us very curious where conduct and character turn, as well as questions of cause of death. The verdict of the jury was as follows: "We are of opinion that Joseph Webb came to his death from congestion of the lungs accelerated by undue exposure, and we consider there is no blame attached to the Land Company, but that Mr. Castledine exceeded his instructions in pulling down the hospital door and not replacing it. And we also consider the after-consequences arose entirely

from Dr. Smith giving permission to pull down the hospital before all the patients were removed, and that the orderly has been guilty of gross neglect of duty." This permission was exactly that which Mr. Smith had *not* given. About two months after Mr. Smith received a communication from the Colonial Secretary enclosing a minute from Governor Broome, dated July 19th, commenting on the circumstances attending the death of Webb and directing plaintiff's dismissal, the dismissal to take effect at the end of 1888. Mr. Smith remonstrated with Dr. Waylen, the chief of the medical department, and with the governor, and finally appealed to the Secretary of State, with no further effect than to prolong his dismissal into 1889. Nothing remained for him but to enter an action by petition of right to recover £1000 damages from the Government for wrongful dismissal. The Government threw every obstacle in his way, even to pleading an infringement of the Royal prerogative. The Attorney-General was against him in the trial and exhausted every argument and theory to defeat his claim. The Chief Justice took a clear position and stuck to it, but the jury gave a verdict in Mr. Smith's favour and assessed the damages at £200. The Attorney-General again sought to reverse the verdict, on the motion of the plaintiff's counsel to have judgment entered for him, but his Honour was unmovable. He admitted the Crown could do almost anything. It could dismiss without notice and without giving reasons, but if it dismissed a man and gave a cause reflecting on his character he had a right to appeal to the public and to go to the jury. He thought the jury had judged rightly, and refused to interfere with the verdict, though he granted stay of execution at the request of the Attorney-General, that he (the Attorney-General) might appeal to a full court as to the right of the Government to dismiss a servant and abuse that servant with impunity. We desire to concede great rights to Governments and to the Crown for public purposes, but we draw the line at the right to cast a slur on faithful public servants and so to injure them and their reputation for life. Mr. Smith deserves the thanks of the profession and even of the public for his dogged fight with the Government of Western Australia in defence not only of his own character, but of a great public principle, and is entitled to congratulations on his success.

### THE PROOF OF DEATH.

THE minds of some persons are haunted by a persistent fear lest their bodies should be buried alive—a fear which is happily almost entirely destitute of any rational excuse. The aspect of death is in every way so different from that of life that it needs no skilled inspection to distinguish it. This is the rule, and one broken but very rarely by an exception. Occasionally, however, some difficulty has arisen even as regards this primary distinction. A case recently reported may be mentioned in illustration. A newly born infant of poor vitality, whose mother died in her confinement, had after a short time apparently died also, and was actually coffined when a cry revealed the fact that it still breathed. Later on the same day the vital flicker again appeared to be extinguished, but this time the care of the medical attendant prevented the occurrence of any mistake as to its existence. It has been suggested that in order to guard against the possibility of any such disastrous oversight in future no certificate of death shall be given except after personal inspection of the deceased by a medical man. We do not know of any objection to this proposal. On the contrary it has much to recommend it. The ordinary signs of death do not require any full explanation on our part. It is worth while to note, however, that such a case as that referred to above is exactly of the kind in which especial care should be exercised as regards this matter. It is where extreme feebleness results in a state of torpor continuing perhaps for days

with faint signs of life, where breath and heart-beat show but an occasional indication, where muscular power is nearly absent, as in old paralytics, and rigor mortis hardly to be depended on, that we seek with some anxiety for absolute proof of death. This is to be looked for in such cases not so much in any isolated sign as in the association of several to the exclusion of all vital manifestations. Among the most reliable indications that life is extinct we would mention rigidity, cadaveric discolourations in relation to position and surface pressure, and as an early and almost certain sign the glairy eyeball, with its pupillary aperture fixed in dilatation.

#### THE MUNICIPALISATION OF HOSPITALS.

THE *Halifax Guardian* of the 10th inst. contains an excellent article deprecating the municipalisation of hospitals. There are two drifts of opinion just now, as respects hospitals, which need to be resisted. One is to make them municipal or State institutions and to rob them of that virtue and charm (which foreigners, notably Guizot, have so much admired) which attach to voluntarily supported institutions and which distinguish them in fact and in various desirable particulars from a workhouse infirmary. Another is to be found among a certain—we hope a very limited—section of the working classes, who take a wrong view of their contributions to these noble charities and are apt to imagine that they carry a right of ordinary medical attendance. Nothing could be more absurd. When a working man contributes to a hospital he contributes to help himself, a fellow-workman, or his wife or child in case of exceptional sickness or accident only; and this is a high privilege and duty. But it carries no right of attendance for ordinary ailments, for which other regular provision should be made by every self-respecting man. The Committee which has been considering the Report of the House of Lords' Committee, we understand, likely soon to give expression to the results of its deliberations. We have every reason to think that it will recognise the private and voluntary character of our hospitals.

#### THE PREVALENCE OF SMALL-POX.

WHILST a wide diffusion of small-pox is still maintained in England and whilst new areas are constantly being added to those already infected, no marked outbreak on an important scale has as yet prevailed except in Warrington, and even there the abatement is maintained, only 12 fresh cases having occurred last week. In Manchester there were during the same period 14 fresh attacks, and in Dewsbury the disease has again broken out, some 12 to 15 patients having sickened. In Leeds 9 fresh attacks occurred, but the patients in the small-pox hospital have been reduced from 56 to 49 in number. At Oldham some 30 patients are in the Westhulme hospital, there are about 29 to 30 under isolation in the hospital used by the Lightcliffe and Hipperholme authorities and 8 patients are in the St. Helens Hospital. In Halifax there were 13 fresh attacks last week; 3 occurred in Barnsley, 3 in Batley, 3 in Chadderton, 4 in Oldham, 2 in Birmingham, 2 in Birkenhead, 4 in Wakefield, 4 in Leicester, 3 in Liverpool, 2 in Sheffield, and slight occurrences, including single attacks, are heard of from Bootle, West Hartlepool, Derby, Northampton, Sunderland, Hull, Lancaster, Runcorn, Nuneaton, Newcastle and Doncaster and also from the rural districts of Leigh and Sedgefield. In the metropolis there were 9 fresh attacks last week and the hospital ships contain about 30 patients. As far as can be judged up to the present date we have to face a somewhat wide dissemination of the small-pox infection; but whether owing to the fact that we have not yet reached the season for its principal activity or to the circumstance that the contagium is not generally prevalent in its most virulent form, there would appear grounds for believing that, apart from the

manufacture—so to speak—of any special virulence of infection, as by the aggregation together of the sick in populous places, the prevalence may possibly pass away without leading to a general epidemic. This, however, is mere surmise, and any hopes based on such a view may at any moment be set aside by the onset of conditions, meteorological or other, that have the faculty of adding to the potency for spread of the prevailing contagium.

#### SPIRITS AND MALT LIQUORS IN WORKHOUSES.

A PARLIAMENTARY return has recently been issued by the Local Government Board showing, in three parallel columns, the daily average number of inmates in the workhouses of union counties, the expenditure on spirits, wine and malt liquors and the average expenditure per head of inmates. The Board has sent these statements to the guardians throughout the country and has especially directed their attention to the great differences in expenditure in respect of wine, spirits and beer for the in-door poor in different districts. These differences do not seem very intelligible from any consideration of climate or circumstance. They are very great. Thus, for example, in Rutlandshire the average expenditure *per inmate* is 12s. 10d., while in the northernmost county of England, Northumberland, it is only 4d. Between these extremes there is every variety of cost per head. In Hertford it is 8s. 2d., in Essex 7s. 8d., in Dorset 4s. 7d., in London 4s. 5d., in Lincoln 3s., and in Lancaster 1s. 10d. The propriety of such allowances is a difficult question to be settled on no extreme principles. It is largely a medical question—for the sick it is entirely so—which medical men should regard in all its aspects. It would be interesting if, together with such particulars, we could have some information as to the comparative health, longevity and period of residence of the inmates of workhouses which differ so greatly in their allowance of alcohol, and to know what other differences of food obtain that may account for or justify such variations in the allowance of articles on which the poor set such store, but to which they often owe their pauperism. We are inclined to think that where this questionable comfort is withheld some pains should be taken to introduce compensation in the form of better food.

#### BILIOUS FEVER, NOT YELLOW FEVER.

DR. DOMINGOS FREIRE, whose researches on yellow fever have from time to time attracted much attention and criticism, especially at the hands of Dr. Sternberg of the United States Army Medical Department, has recently<sup>1</sup> demonstrated the fact that the bilious fever of hot countries is a distinct disease from yellow fever, that the symptoms are entirely different, and that the bacteriological causes are also distinct. As regards symptoms he finds that in yellow fever there are three distinct periods—(1) a period of hyperpyrexia, which lasts for twenty-four or forty-eight hours; (2) a short variable period of apyrexia; and (3) a recurrent hyperpyrexia, during which the phenomenon of hemorrhage and the ataxo-dynamic symptoms appear. The icterus comes on during the second or third period and sometimes even only after death. There are the peculiar look of the face, the watery vomit, which gradually becomes darker or even black, this symptom continuing for a long time; the marked constipation, and only in the later stages diarrhoea. Yellow fever is contagious and does not usually recur; there is no enlargement of the spleen except where there has been antecedent malaria. It is entirely intractable to the use of quinine and its salts. The organism associated with its etiology Dr. Freire thinks is a micrococcus, the so-called micrococcus xanthogenus. In bilious fever, on the other hand, there is a regular

<sup>1</sup> Sur l'Origine Bactérienne de la Fièvre Bilieuse des Pays Chauds. Rio de Janeiro, 1892.

periodic advance, sometimes intermittent, sometimes remittent; in the first case, with marked irregular exacerbations; in the second, with a febrile exacerbation which generally occurs towards evening or during the night. The yellow colouration generally commences at the beginning of the disease and continues throughout its whole course. The characteristic facies of yellow fever is quite wanting, the vomit matter is yellow or green from the commencement and gradually diminishes as the disease advances, bile-stained motions are passed during the whole course of the disease; it is only slightly infectious, but the patient is subject to recurrence of the disease; the liver and spleen are hyperæmic and congested and they often undergo fatty degeneration. The implication of these organs, together with the fact that quinine salts have an almost specific action upon the progress of bilious fevers, indicates that this disease is probably of a malarial nature. Dr. Freire was able, moreover, to isolate a bacillus about  $\frac{1}{10}$  of a millimetre in length and  $\frac{1}{100}$  of a millimetre in breadth, non-motile, deeply stained by methyl violet, sometimes slightly curved and usually containing a single spore at its extremity. These, if not identical with, resemble the organisms described by Klebs and Tommasi-Crudeli. When inoculated they are fatal to guinea-pigs, from the bodies of which they may again be separated. It is interesting to note that he was able to obtain these organisms not only from the blood, but also from the urine and from the bile.

#### LONDON LAUNDRIES.

APART from the sanitary condition of laundries, which is often so defective as to gravely compromise not only the health of the washerwomen, but that of their customers, complaints have recently and justly been made against the reckless destruction of the linen. The linen is corroded with lime, frayed out and torn with rough handling and wire brushes; flannels are shrunk so that they can no longer be worn, or if worn they are unhealthy, for they have lost their porosity and have become hard pieces of woollen board. In these days of technical education cannot better technical instruction be given to laundresses? and at the close of this century of scientific progress, if "chemicals" must be used, cannot some chemical substance be found that will be less destructive in its effect than those actually employed by laundresses? Any circumstance that leads the public to hesitate in sending clothes to be washed is detrimental, as cleanliness is the first law of health. The whole question of laundry work is important and urgent. With the continually increasing concentration of population the difficulty of washing the linen becomes greater and greater; and new and more scientific methods will have to be applied to meet the circumstances of the case.

#### NERVE ROOTS OF THE BRACHIAL PLEXUS.

IN the Proceedings of the Royal Society a paper appears by Dr. Risien Russell, giving the results of an experimental investigation of the nerve roots entering into the formation of the brachial plexus of the dog. The methods employed were: (1) Observation of the compound movements in the fore limb of the dog by electrical stimulation of the peripheral end of a whole nerve root which had previously been exposed and divided; (2) minute differentiation obtained by electrical excitation of the individual bundles composing such a nerve root; (3) direct observation (after dissection) of the muscles thrown into action by electrical stimulation of the separate nerve roots, and the determination of the question whether a single bundle of fibres representing a single simple movement remains distinct in its course to the muscles it supplies without inosculating with other nerve fibres; (4) whether, when a muscle receives nerve fibres from more than one nerve root, both nerve roots supply fibres to one and the same muscular fibre; (5) the influence

of section of one or more roots in excluding certain muscles from a generalised epileptic spasm induced in the limb by cortical excitation; (6) differentiation of parts of nerve roots by the degeneration method. The conclusions from these various methods are confirmatory one of another. It is found that the compound movement obtained by stimulation of a whole nerve root is the result of the synergic action of a group of muscles, an effect which may be resolved into its component parts. The simple movements bear a constant relation to the nerve roots—e.g., flexion of the elbow is always represented one root higher than extension,—and fibres subserving a certain movement have a constant position in the same nerve root—e.g., extension of the wrist is represented by a bundle of fibres in the upper part of the circumference of the root. Each bundle of nerve fibres remains distinct in its course to the muscle or muscles, producing a movement without inosculating with other motor fibres. The action of certain muscles is always found to predominate on stimulation of one root, and if flexion is the gross result of stimulation of one root, extension is the predominant result of the excitation of another. It is also found to be possible by stimulation of a single bundle of fibres in a nerve root to produce contraction of a single muscle, and of it alone, although the same muscle is always represented in more than one root, but to an unequal extent in these. The muscular fibres innervated by one root, however, are not supplied by the other. Similarly by division it is found that a temporary paresis is produced in the group of muscles supplied by a nerve root, but there is no incoördination of the remaining muscular combinations, and in an epileptic spasm produced by cortical excitation the position assumed by the limb is modified by the division of a nerve root, the modification being the result of throwing out of action the muscular combinations subserved by the divided nerve root. The degeneration experiments confirm the results; but the Wallerian law is found to be erroneous in regard to the degenerations resulting from division of the nerve root on the distal side of the ganglion; for, in addition to peripheral degeneration in such a root, degenerated fibres are also found in the part of the sensory root between the ganglion and the spinal cord, a condition which makes it likely that there are certain nerve fibres which do not depend for their trophic supply on the ganglion.

#### RAILWAY SIGNALMEN.

IN consideration of the fact that so great a proportion of railway accidents have been occasioned by errors in making or in reading signals, it is clear that too much attention can hardly be paid to this department of railway management. Our readers will therefore excuse another reference to a subject, well worn indeed but unhappily never trite. Three weeks ago while discussing the Thirsk accident we suggested the adoption of some system which would obviate as far as possible the necessity of depending for security of life and limb upon the limited and variable capacity of any railway servant. An incident which occurred the other day near Wakefield is worth noting in this connexion. In this case a signalman, apparently in his usual health and on duty, died suddenly, the fact being only discovered when inquiry was made as to why his signals were not working. Of course it is impossible, by the most perfect method, to obtain absolute immunity from the risk of accident. We are also pleased to note the great skill and energy which have been expended by railway companies upon this part of their organisation and the large measure of success which has rewarded their efforts. Not even these considerations, however, can diminish the pressing necessity for further improvements which are suggested by the incident above mentioned. In particular we would again direct atten-

tion to the advantages connected with a system of interlocking signals. Such a system, controlled by electricity and capable of acting only in obedience to that control, is now, we understand, in action upon some lines. It by no means does away with the labour of signalmen, but it greatly diminishes its anxious responsibility. We should therefore welcome its more general introduction. Such a reform, combined with a considerable addition to the numbers of the working staff, should go far to secure for travellers by rail that safety which is their minimum of right.

### INFLUENZA.

WE observe in some quarters the expression of a fear that influenza is likely to recur in epidemic form this winter. That in many places there are—and have been for some time—sporadic cases of the malady there can be little question; but, so far as previous experience goes, it is improbable that it will prevail to anything like the extent to which it has done in the past three winters. It is, however, conceivable that local outbreaks may occur in this country, just as in France and elsewhere they have often occurred in the intervals between the greater invasions; and it is therefore incumbent upon us to be alive to this possibility, and inculcate on the sufferers the necessity of the avoidance of fatigue and exposure in the early days of convalescence which so often retard recovery or promote grave sequelæ.

### THE LOUTH GUARDIANS AND THE DISMISSAL OF DR. BEST.

A VERY remarkable incident lately happened at the Louth Board—the dismissal by 21 votes to 13, practically without notice and without complaint or reason, of Dr. Palemon Best, medical officer of the Grimoldby district, and the appointment in his place of another medical man who does not seem to have made a direct application for the appointment, though a guardian stated he was prepared to say that he would take it. We were about to express ourselves most strongly on this procedure in our present number as one of the most monstrous and unreasonable steps ever taken by a public body against an officer of high local standing, high professional qualifications and boasting of twenty-five years' service; but on the point of going to press we learn with satisfaction that the guardians have rescinded their former resolution by 17 votes to 8. For twenty-five years Dr. Best had been reappointed without being present or being required to be present. A sort of notice was given him of the meeting at which his appointment was cancelled, but so slight that he did not realise its seriousness and did not attend; but after his most unjustifiable dismissal he demanded, like an honest servant, a hearing, with the result we have stated.

### HYSTERIA IN CHILDREN.

DR. F. JOLLY contributes a paper on this subject to the *Berliner Klinische Wochenschrift*. Hysteria in children may take the form of periodical outbursts of peculiar mental disturbances or may produce local symptoms. Most commonly vague pains are complained of in various parts of the body (particularly in the joints), these pains being frequently accompanied with spastic conditions of the limbs (rarely paralyses) and anæsthesias. Both sides of the body are affected in the great majority of cases, although occasionally there may be a monoplegia or hemiplegia. To the above symptoms tremors may be added; these tremors may in some cases be the first thing complained of, especially in cases where traumatic influences have been at work. Further, spasms may occur in the muscles of speech and respiration (sharp cries, singultus &c). The speech may become stammering or confused or the patient become perfectly dumb for a longer or shorter period, and this may even be accom-

panied by deafness. In some cases observed by Dr. Jolly "hysterical blindness" occurred. As regards anæsthesia of the skin and deeper parts this was usually but slightly marked—diminution of the sense of touch, lessened sensation to pain and contraction of the field of vision. The hysterical attacks were generally characterised by screaming, crying and laughing, accompanied by convulsive movements of the extremities. There was commonly some slight loss of consciousness, but as a rule the patient retained some recollection of what had occurred. The treatment which proved most effectual was isolation, dashing cold water over the child, the faradaic current and judicious verbal correction. With regard to the cause of the hysteria, Dr. Jolly found that there was in most cases a history of a nervous disposition in the parents, this being frequently added to by debilitating diseases and bad feeding, anæmia and unfavourable moral surroundings. Education and imitation also exerted powerful influence.

### MODEL LODGING HOUSES.

IT is satisfactory to note that the very active propaganda made in favour of the better housing of the poor and of the working classes is bearing more fruit. In the course of a week we read of the opening of two model institutions of this description. One named Rowton House, close to Vauxhall station, will accommodate 470 toilers at the rate of 6*d.* a night; and the other, in Macklin-street, Drury-lane, will hold 100 persons at the same charge. But close at hand—in Parker-street—the County Council is building a lodging-house which will probably bring down the rent at present levied. It must be remembered that the ordinary price is 4*d.* a night in a registered lodging-house, and that therefore these two model establishments do not cater for the poorest, the lowest, the dirtiest sections of the population, for those in fact who most need "paternal interference." They will, however, help those who are already seeking to help themselves and will make their path upwards towards respectability more easy to tread. This, though not the most needful, is nevertheless good work. The artistic decorations of the lodging houses and the facilities for reading will do much in the educational sense; while the excellent provision for cooking, washing of clothes and of the person, and the effort to grapple with the difficult question of ventilation will very materially contribute to the improvement of health.

### THE ADMINISTRATION OF PURE OXYGEN.

ADVERTING to the employment of oxygen for the limelight and other purposes, Mr. T. C. Hepworth points out that the success of this comparatively new industry (the separation of oxygen from the air) has been so marked that, as a natural result, competitors with rival processes have come forward. But, according to his experience, the rival product turns out oftentimes to be not oxygen, but a half and half mixture of oxygen and air, with a slight excess of the latter. He recently obtained, for instance, a sample of gas from a dealer, which on testing (with a Hempel absorption pipette charged with metallic copper and ammonia) was found to be a mixture containing only 60·6 per cent. of oxygen. He next tested the illuminating power of this highly diluted oxygen with a lime-light jet, and for sake of comparison placed by its side a precisely similar jet supplied with Brin's oxygen, and as might have been expected, the light given by the former was little more than half as intense as that afforded by the latter. With the good oxygen the lime cylinder was quickly pitted, whilst the other showed no symptom of destruction. It is also to be remarked, he says, that the consumption of the diluted gas is, for a given period, about one-third more—striving with both jets to get the best possible light—than that of good oxygen. On the same principle, a mountaineer at a high altitude will pass a greater volume of air through his lungs in a given time than he will when he is in the valley breath-

ing that which contains the normal quantity of oxygen. He concludes that this matter is of great importance to many workers, and might be one almost of life and death in the case of a patient for whom inhalation of oxygen had been prescribed. If this be so, our readers will be grateful to our correspondent for these words of necessary caution.

#### DRAINAGE OF FROGNAL.

THE inhabitants of Hampstead and Frognal are becoming alarmed at the appearance of typhoid fever and diphtheria in their midst and seem disposed to blame the main drainage of Frognal for their continued prevalence. The matter has been referred to the London County Council, who will doubtless make inquiry into the allegations that have been made.

#### TYPHUS FEVER IN DUNDEE.

THE spread of typhus fever from Dundee into the neighbouring village of Monifieth is creating a scare and will, it is expected, lead to the provision of some form of permanent hospital isolation in the district. Scarlet fever and measles are also causing anxiety and parents are urged to discourage during the Christmas holidays assemblages such as children's parties, which are often a fruitful source of epidemic extension of those diseases.

#### TREATMENT OF LUPUS.

DR. SHLAPOBERSKI has found the caustic action of nitrate of silver in contact with iodoform, which it decomposes with a hissing noise, very efficacious in the treatment of lupus. In an obstinate case he scraped away all the large nodules and applied nitrate of silver, afterwards covering the parts with collodion containing 10 per cent. of iodoform. The treatment was renewed daily. In three months there was a decided improvement, and in seven months the parts were entirely healed. There has since been no recurrence though more than four years have elapsed.

#### CORROSIVE SUBLIMATE AS A GERMICIDE.

DR. C. T. McLINTOCK<sup>1</sup> has made some extensive researches upon corrosive sublimate as a germicide. His experiments show that this substance is not a strong germicide, as germs withstand its action for some time. He maintains, however, that though corrosive sublimate is not a good germicide that is no proof that it may not be valuable as a disinfectant. As is well known, of all substances it has the greatest antiseptic power, and, according to Dr. McLintock's theory, a germ treated with sublimate, unless perchance it gets into the blood or is exposed to very exceptional conditions, is powerless to grow—that is to say, it is probable that a spore of subtilis or anthrax treated with sublimate (1 in 1000) and then thrown on the soil or into water will not germinate owing to the fact that the capsule of sublimate surrounding it is not removed. The former experiments alleged to prove its germicidal power were faulty, inasmuch as in some there was carried over with the disinfected material enough of the sublimate to act as an antiseptic; in others, as those of Abbott, it was not recognised that the sublimate combined with the investment of the germ and prevented any growth, especially in solid media. Again, different cultures have, as pointed out by Esmarch and Gruber, very varying powers of resistance, an all-important factor in determining the germicidal value of any agent. Corrosive sublimate forms with cellulose, as cloth, filter paper &c., with silk, with albuminous bodies, with some part of bacteria, probably the envelope, a chemical compound that cannot be removed by any amount of washing with water. This sublimate when acting on a germ forms a capsule around it that protects the germ for a time from the further

action of the sublimate, and in turn forms an impenetrable barrier to the growth of the organism unless removed. This barrier may be removed with salines and is more rapidly removed in proportion to the renewal of the saline, conditions that are fulfilled in the circulating blood. The action of sublimate on bacteria is probably closely analogous to that of alcohol. All experience leads to the belief that absolute alcohol is immediately fatal to protoplasm, and the only way that we can explain the fact that spores may survive in absolute alcohol for weeks is on the assumption that the alcohol somehow changes the envelope of the spore, rendering it impermeable. Dr. McLintock thinks with De Barry that the presence of a gelatinous envelope in many, if not all, bacteria at certain stages of their life history has not received the attention it deserves. This envelope probably serves the organism in protecting it against temperature, dehydration and chemical agents. Whether the germs contained in solutions treated with sublimate, and disposed of as such material usually is, do or do not grow remains to be proved.

#### PREVALENCE OF MEASLES.

MEASLES is still rife in various parts of the country, affecting chiefly school children, and the question of school closure affords ground for animated debate as well as for divergence of opinion and practice. Thus at Leith, where the disease is still extensively prevalent and many children are away from school, it has been eventually decided that the schools shall remain open. On the other hand, at Wishaw, Pudsey and Hull it has been determined to resort to closure. At the latter place there have during the past four weeks been some 600 cases and forty of them have proved fatal. In the face of this it has been wisely decided to include measles in the list of notifiable diseases, at least for a time. It is pleasing to learn that measles is distinctly declining in Aberdeen.

#### THE CORONER OF OXFORD AND THE INFIRMARY.

THE *Oxford Times* of Dec. 17th contains the report of an inquest on the body of a dairyman, who had lately been in failing health. After delivering all his milk on Dec. 6th he was found dazed and ill by the side of his horse, which he was holding by one hand. One of the witnesses, Mr. Charles Howard, gave an excellent account of his symptoms and of going to his assistance. Deceased was taken to the infirmary on an ambulance and died the next morning. He was promptly seen there by the house surgeon, who diagnosed cerebral hemorrhage, of which there was hemiplegia and every other symptom, and by him was transferred to Dr. Dalgliesh, the house physician, a graduate of Durham, who had held similar offices in Leeds and Newcastle. Dr. Collier was in the hospital almost immediately afterwards, but an urgent diphtheria case requiring tracheotomy distracted Dr. Dalgliesh's attention and he forgot to ask Dr. Collier to see the case. The man got worse so rapidly and his condition was at once so hopeless and so clear in a diagnostic sense that he did not send for Dr. Collier. A certificate in accordance with the facts was given. But the coroner "heard enough," as he thought, to stop the funeral, hold an inquest, and make some very severe reflections on the infirmary and the patient being there twenty-four hours without seeing one of the physicians. Undoubtedly urgent cases should be seen as a rule by the honorary officers; and here it would have been well had this been the case. But we think the remarks of the coroner were greatly in excess of what was called for. The man received prompt attention from two able officers and according to the clear evidence every care that could have benefited or saved him. We think it would have been much better had the coroner ordered a post-mortem examination and supplied the jury with solid facts in place of his own remarks.

<sup>1</sup> Medical News, Oct. 8th, 1892.

ACUTE MIGRATORY OTITIS.

DR. SZENES of Budapest proposes the term "acute migratory otitis media" for a class of inflammatory diseases of the middle ear. He has seen three instances in which one side is first affected and about three days after complete recovery the middle ear of the opposite side. This migration or metastasis is not easily accounted for, but it may be analogous to the somewhat rare migratory form of pneumonia where a small portion of the lung is first attacked and after its recovery another and perhaps distant and larger portion becomes affected. In the first case of migratory otitis seen by Dr. Szenes the left ear was first attacked, the process becoming suppurative. When the inflammation appeared in the right ear energetic measures—as local bloodletting and cold compresses—were successfully employed to prevent suppuration. In the second case there was no suppuration either in the right ear—which was the one first attacked—or in the left. In the third case there was suppuration on both sides.

FOREIGN UNIVERSITY INTELLIGENCE.

*Rostock.*—Dr. Christian Lemcke, who has been Docent in Laryngology and Otology since 1885, has been raised to the rank of Extraordinary Professor.

*St. Petersburg (Military Medical Academy).*—Dr. Blumenau has been recognised by the conference of the Academy as *privat-docent* in Diseases of the Mind and of the Nervous System, Dr. Massen as *privat-docent* in Midwifery and Gynæcology, and Dr. N. Kuskoff as *privat-docent* in Pathological Anatomy.

*Tomsk.*—There are now 302 students in this University which at present contains only a medical faculty. The majority of them were educated at clerical seminaries in European Russia and at gymnasia in Siberia. A great many

of them are in needy circumstances, and are receiving assistance from various sources. The cost of the University to the imperial funds amounts to about £20,000 annually. During the past year surgical, therapeutical, obstetric and gynæcological clinics have been opened, though the number of beds is very limited. Next year clinics for children and for eye and skin diseases are expected to be opened, besides a second surgical clinic.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.

THE deaths of the following distinguished members of the medical profession abroad have been announced:—Dr. Kraus, Medical Inspector in Hamburg, of cholera, in Altona.—Dr. Karl Petersenn, formerly chief Medical Officer of the Riga Marine Hospital.

A MEMORIAL has been presented by Sir Henry Roscoe, M.P., to Earl Cowper, chairman of the Royal Commission on the proposed Gresham University. The memorialists "respectfully record their strong opinion that the foundation of a teaching university for London, without due provision being made for higher education and original research, would be unworthy of the metropolis, and would entail the neglect of an admirable opportunity for promoting the advancement of science and learning."

THE Library of the Royal College of Surgeons has been enriched by the presentation of a large collection of Russian medical dissertations and other works by Dr. Theodore Maxwell of Woolwich. Dr. Maxwell, whose linguistic powers have been amply exhibited in his valuable "Terminologia Medica Polyglottica," has also prepared a catalogue of these works, containing references to abstracts of some of them which have appeared in THE LANCET and elsewhere.

LUNACY IN ENGLAND, SCOTLAND AND IRELAND DURING THE YEAR 1891.

WE have before us the Reports for the year 1891 of the Commissioners in Lunacy for England, of the Commissioners in Lunacy for Scotland and of the Inspectors of Lunatics for Ireland. The returns show that the numbers of the insane under official cognisance in the three portions of the kingdom on Jan. 1st, 1892, were:—

—	Males.	Females.	Total.
England and Wales ..	30,030	48,218	87,848
Scotland .. .. .	5982	6817	12,799
Ireland .. .. .	8405	8284	16,689
Total .. .. .	54,017	63,319	117,336

Dealing first with the report on lunacy in England and Wales it is found that there is an increase in the numbers of 1053 as compared with those returned on Jan. 1st, 1891.

While these are the numbers under the official cognisance of the Commissioners they say in a footnote that the detailed report of the Registrar-General showing the total number of insane persons in England and Wales as enumerated at the last census will not be published for another year. In the statistics of the report the statutory definition of the word "pauper" is adhered to as meaning a person who is "wholly or partly chargeable to a union, county or borough," whilst the word "private" is held to include all persons who are not paupers. The figures in January, 1892, show, as compared with the previous January, an increase of 73 (40 males and 33 females) in the private class, an increase of 954 (418 males and 536 females) in the paupers, exclusive of an increase of 26 (10 males and 16 females) in the criminal patients. A decrease of 300 in the insane in ordinary workhouses is regarded as in some measure due to the removal to asylums of patients not unfit for workhouse care, but for whom there is in workhouses a deficiency of accommodation and an indisposition on the part of guardians to provide it by building. Another year's experience confirms the Commissioners in their opinion that the costly proceedings under Section 24 of the Lunacy Act by magistrates' orders and medical certificates tend to restrict the registration of patients in workhouses and

The following summary shows the classification and distribution of the patients on Jan. 1st, 1892.

Where maintained on Jan. 1st, 1892.	Private.			Pauper.			Criminal.			Total.		
	M.	F.	T.	M.	F.	T.	M.	F.	T.	M.	F.	T.
In county and borough asylums .. .. .	445	558	1,003	24,300	30,048	54,414	09	23	92	24,880	30,029	55,600
In registered hospitals .. .. .	1,840	1,696	3,526	143	92	235	2	1	3	1,985	1,770	3,764
In licensed houses:—												
Metropolitan .. .. .	800	833	1,630	374	573	947	—	—	—	1,180	1,406	2,686
Provincial .. .. .	592	810	1,402	276	362	638	8	—	3	871	1,172	2,043
In naval and military hospitals and Royal India Asylum .. .. .	240	10	250	—	—	—	—	—	—	240	16	256
In Criminal Lunatic Asylum, Broadmoor .. .. .	—	—	—	—	—	—	482	157	639	482	157	639
In workhouses:—												
Ordinary workhouses .. .. .	—	—	—	4,087	6,272	10,050	—	—	—	4,687	6,272	10,950
Metropolitan district asylums .. .. .	—	—	—	2,841	3,098	5,030	—	—	—	2,841	3,093	5,939
Private single patients .. .. .	105	252	447	—	—	—	—	—	—	105	252	447
Out-door paupers .. .. .	—	—	—	2,260	3,437	5,700	—	—	—	2,260	3,437	5,700
Total .. .. .	4,118	4,155	8,273	34,056	43,892	78,838	556	181	737	30,030	48,218	87,848

also sometimes promote the removal to asylums of cases which might be adequately cared for in workhouses. It is, we think, high time, as we have several times pointed out, that steps should be taken for the removal of such stumbling blocks to the proper working of an Act which has much to recommend it in many respects.

From Table I. we gather that the numbers of the insane at the various stages of ten years from 1859 were the following:—

1859	::	::	30,762		1870	::	::	60,885
1869	::	::	53,177		1880	::	::	84,840

The numbers on Jan. 1st for the last three years were: 86,067 in 1890, 86,795 in 1891, 87,848 in 1892. The average annual increase in the ten years from 1882 to 1892 was:—

	Males.	Females.	Total.
Private .. .. .	21	55	76
Pauper .. .. .	566	657	12 3
Criminal .. .. .	1	—	1
<b>Total .. .. .</b>	<b>588</b>	<b>712</b>	<b>1300</b>

The total lunatics to population were in the following ratio per 10,000:—

1859	::	::	18.67		1890	::	::	29.02
1869	::	::	23.93		1891	::	::	29.86
1879	::	::	27.54		1892	::	::	29.88
1889	::	::	20.65					

On this subject the Commissioners have had to correct the figures that they had entered in the last few reports. They state that "as the annual increase of population for the last nine years appears to have been somewhat over-estimated, the fresh calculations now published show that the ratio of the fresh admissions to the corrected population is somewhat higher than was previously apparent." "Taking into account," they add, "that the admissions of the last two years have been swelled by the reception from workhouses of a considerable number of patients previously classed therein as of unsound mind, and enumerated in our returns, and only removed owing to insufficient accommodation in the workhouses, this Table does not indicate that the ratio of fresh cases of insanity to the population is materially increasing." It is something, at all events, to get a definite expression of opinion from the Commissioners on this vexed question. It is satisfactory indeed that the complicated statistics on the point have at last reached a stage of settlement, as it were, which permits a reckoning to be made in terms such as those used by the Commissioners, who are best able to sum up all the *pros* and *cons* that must be weighed before anything like an authoritative opinion can be arrived at. The feeling throughout the country, due partly to a greater interest in the subject and partly to the daily announcement of the enlargement of our pauper and other asylums, is undoubtedly that an absolute increase of the insane to the population is taking place. We take it that the measure of this increase is the satisfactory one given by the Commissioners—namely, that it is not a *material* increase. Our curiosity in this matter will not be satisfied until we have seen the forthcoming return of the Registrar-General as to the total number of insane persons throughout the country, including those who are outside as well as those who are within official cognisance. For it cannot be doubted that the still remaining difficulties as to certification and the cumbrousness generally of the process of having a person for his own good removed to proper asylum care compel a large proportion of lunatics to wander and drift about in our midst to the no small danger of the community or of themselves.

The insufficiency of asylum accommodation is strongly commented on by the Commissioners. The pressure for asylum room continues in undiminished severity, and the Commissioners do not find that County Councils are more prompt than their predecessors who had the control of asylums in adopting measures of relief. They refer to at least twenty counties that are defective in respect of the provision of proper accommodation for their insane, and their strong remonstrance on the subject ought to have weight with County Councils and make them bestir themselves for ameliorating the condition of the hapless insane who come under their jurisdiction.

In other asylums defective sanitation gives only too much colour to the belief that its influence is productive of diseases which would not otherwise present themselves among asylum

inmates, and for this no sort of excuse can be advanced. Mere want of money must not be urged under such circumstances where a person is shut up and has his health seriously, if not fatally, attacked by dysenteric diarrhoea, typhoid fever, pneumonia, erysipelas &c. arising from foul drains, defective closets and the like. The Commissioners continue to recommend in all cases where defective sanitary conditions exist a thorough rearrangement of drains and sewerage under competent advice as at once the most effectual and the most economical remedy.

(To be continued.)

## CHOLERA.

### CURRENT NOTES, COMMENTS AND CRITICISM.

THERE is much more difficulty in affording an accurate chronological and geographical record of the distribution and progress of cholera from week to week than might be supposed. In the first place, there is a good deal of reticence on the part of officials and others about notifying cases on account of the real or supposed injury that any declaration of the kind might cause to the commercial and other interests of the locality or town concerned; then there is the difficulty attending the appearance of isolated or sporadic cases that their precise nature cannot always be determined at the time, and the consequent delay involved. But it is safer under the circumstances to include all cases of apparent among those of real cholera at the present time; for it is these sporadic cases that possess a good deal of significance as indications, on the one hand, that the disease is not dead, and, on the other, they occasionally serve as aids in attempting to forecast the future. Another difficulty, too, in preserving an accurate cholera record arises from the occasional repetition by different papers of intelligence already recorded as if it were new. For instance, the figures forming the total number of cholera cases and deaths in Russia recently announced as the latest official statistics have been already published in THE LANCET of last week.

There have been some indications of a recrudescence of the disease on the Continent during the past week. The weather has been exceptionally warm and damp for the season. The temperature at Hamburg, for instance, was 50° F. at the beginning of the week.

As regards France there were 6 deaths from cholera in Paris in the week ending the 3rd inst. and 4 deaths from diarrhoea among adults. At Dunkirk an *infirmier* at the cholera barracks died of that disease on the 15th, and a fresh case is reported at Condekerque-Branche, a village close to Dunkirk. We have heard nothing lately from Marseilles nor have we learnt any particulars of the extent of the outbreak—said to be serious—at L'Orient or of that at Epernay.

At Hamburg there has been a reappearance of the disease, although not to any extent. The Cholera Commission of the Hamburg Senate announces that a patient brought to the hospital for treatment on the 16th and another who was taken ill subsequently have been found to be suffering from Asiatic cholera. One of the cases originated in the city and the other in the suburb. No cases have occurred in the harbour district since Oct. 13th last. A death from cholera took place at Hamburg on the 12th, and two fresh cases occurred in the same house in that city on the 16th inst. According to the latest intelligence two fresh cases of cholera were reported on the 21st inst., and it is stated that there were also seven cases of suspected cholera. The Commission subsequently reported that the two cases which occurred on the 20th were found to be cholera on bacteriological examination, but both appear to be a mild form of the disease, one of the patients being already nearly well. The Board of Health have been occupied, it is alleged, in preparing for a possible fresh outbreak of the disease in the spring.

From Budapest it was reported at the beginning of the week that cholera had broken out in the garrison of the fortress of Peterwardein in South Hungary, but no further intelligence in regard to it has since reached this country. There were two fresh cases and one death reported from Pest on Sunday last.

## PRECAUTIONS AGAINST CHOLERA.

## CONFERENCE OF PORT MEDICAL OFFICERS OF HEALTH.

DR. COLLINGRIDGE, medical officer of the port of London, is to be congratulated for taking the initiative in convoking a conference of port medical officers of health. The Lord Mayor of London has also rendered great service in throwing the Mansion House open to this meeting and by the hospitable reception he accorded to the medical officers. The result has been a good attendance of port medical officers, though there were some absences which were as significant as they were to be deplored. Dover, Folkestone and Newhaven were not represented, though it is at these three ports that by far the greatest number of passengers coming from cholera-infected districts have landed and are continuing to land, for the cholera epidemic has not yet entirely subsided. There were present at the Conference Dr. Collingridge for the Port of London; Dr. Mason, Hull; Mr. Harris, Southampton; Mr. Gurney, Harwich; Dr. Armstrong, Newcastle; Dr. Wood, Sunderland; Dr. Piggott, Teignmouth; Dr. Lawton, Poole; Dr. Malcomson, the Tees; Dr. Elliston, Ipswich; Dr. Styan, Ramsgate; Mr. Watson, Rochester; Dr. Brown, Colchester; Mr. Bately, Great Yarmouth; Dr. Wynne, Lowestoft; Mr. Wellington, Wisbech; Dr. Fausset, Fleetwood; Dr. Simpson, Weymouth and Portland; Dr. D. S. Davies, Bristol; Dr. Campbell, Gloucester; Mr. E. Davies, Swansea; Dr. Walford, Cardiff; Mr. Tratman and Mr. J. C. Heaven, Bristol (assistants); Mr. Williams, Plymouth; Mr. Griffith, Milford Haven; Dr. Evers, Faversham; Mr. Clegg, Boston; and Mr. E. P. King, Chepstow.

The Conference met on Saturday morning and the proceedings were opened by the Lord Mayor, who said he was proud to welcome the medical officers who had so far perfectly succeeded in protecting England from the scourge of cholera. He congratulated the medical officers for seeking to come together so as to carry out their work in an intelligent and uniform manner. By exercising their powers with gentleness and without unnecessary severity they would best succeed, for they would thus avoid exciting the ill feeling of a large section of the community.

The Lord Mayor having retired, Dr. Collingridge was elected to the chair. The Conference commenced by discussing a resolution brought forward by Dr. Armstrong of Newcastle, to the effect "That it is desirable that medical inspection for the prevention of cholera should be kept up by day and by night without any intermission." To this it was objected that a very large increase of the existing staff would be necessary, and Dr. Mason of Hull maintained that it was extremely difficult, and often very dangerous, to carry out night inspection on the rough and broad waters of the Humber. The Chairman, however, stated that the resolution only suggested the desirability of night inspections as a general principle, though of course exceptions might be made where justified by special local difficulties. The words "as a general principle" being added after "it is desirable," the resolution was carried by 24 to 4 votes. It was further decided that all ships coming from an infected or suspected port should be thus inspected, and then followed a lengthy discussion as to what ports were to be considered infected. Dr. D. S. Davies moved that an official list of foreign infected ports should be issued by the Local Government Board. Mr. Harris suggested that such a list, if published in the *Official Gazette*, would prevent the friction and disputes that arose between port officials and ship captains and owners as to the ports that were or were not infected. Dr. Armstrong thought that there ought to be some compulsory form of international notification; this should comprise the notification of suspicious cases; for it was while "people were fiddling about with bacteria" that all the mischief was done. Dr. Collingridge, however, urged that no Government dare issue such a list. At the present moment the whole coast line from St. Petersburg to L'Orient was infected. Hamburg was still infected, yet no Government, in the face of the official declarations to the contrary, dare place Hamburg on an official list of infected ports. The only practical course would be for the medical officers themselves to issue a list for their own guidance. Other speakers complained that the Government had not given sufficient help and that ships arrived with clean bills of health given them by British consuls, though the newspapers all declared the towns in question to be infected. It

was a difficult matter to make a ship miss a tide when the evidence as to infection was of so conflicting a character. Dr. Davies of Bristol seconded Dr. Collingridge's proposal. Dr. Wynne of Lowestoft urged that the chief difficulty was with the fishing boats, especially the steam trawlers that run in and out so rapidly from different ports according to the condition of the fish market. This opinion was endorsed by Mr. Griffith of Milford Haven. The Congress then decided that the London Port Sanitary Authority should be requested to issue as occasion arose a list of infected ports, for the guidance of all the port medical officers.

The next question was the power to stop ships for medical examination. Dr. Mason maintained he could not properly examine 300 or 400 emigrants in the dead of the night and that he ought to have power to keep ships from entering dock before daylight. Mr. Harris agreed that ships should not be allowed to enter dock without a certificate and should therefore have to wait till the medical officer had been able to visit the ship and give the certificate. If the ship owners or their agents would agree to help the delay would be but slight, as they could warn beforehand the medical officer when their ships were approaching the port. Another delegate suggested that as the pilot was master of the ship pilots could be informed that according to the cholera circular they would be fined £50 if they brought the ship in previously to its being visited by the medical officer. Then, again, an arrangement could be made that no Custom officer should go on board till after the medical inspection. These suggestions had been carried out in several ports. Mr. Wellington of Wisbech caused a considerable sensation by explaining that he lived six miles off the port and that he was sometimes nine miles away on his rounds when a ship came in. It was the little ports that were the weak side in our armour. In large ports the work was done fairly well. To catch a ship at Wisbech he had been obliged to start at three in the morning and go out a distance of fifteen miles over rough water. Dr. Armstrong energetically declared that the little ports offered the greatest danger; they were the back door through which the cholera would enter while the front door was carefully guarded. The Conference ultimately decided to approach the Local Government Board so as to ask for compulsory powers of detention of ships from suspected or infected ports, and that these ships should not be released till they had received a certificate from the port medical officer. This was carried unanimously. It was further resolved unanimously, in respect to the 17th Section of the Quarantine Act, "that the detention of the port medical officer on board ships not having received pratique is objectionable." As a matter of fact, medical officers came off such ships constantly, though by so doing they were liable to six months' imprisonment and a £300 fine. In view of increasing the staff of port medical officers and so as to satisfy the exigencies of commerce the Conference voted that it is desirable arrangements should be made for the prompt medical inspection of ships arriving from infected or suspected ports and their subsequent supervision. As so many ships came from ports that are but a few hours' journey away their subsequent supervision is very essential. Then, again, the Conference decided that false answers made to questions put by the port officials to masters of ships concerning the health of anyone on board should be treated as a penal offence. The Conference laid down the principle that all ships from infected or suspected ports should be treated as infected till found otherwise and this was to apply equally to short sea passages. If in spite of this the ship entered dock the penalty, instead of being only £50, should be so increased as to act as a genuine deterrent. Mr. Harris related that a ship's master whom he had kept out of the Southampton docks afterwards stated that, had he known the penalty was only £50, he would have entered in spite of instructions to the contrary. Complaints were made that fishing boats carried no flags at all, and it was urged that vessels coming from infected ports should signal themselves. On the proposal of Dr. D. S. Davies, seconded by Dr. Wynne, it was resolved that "power be obtained to enforce the hoisting of a signal by all vessels, including fishing boats, coming from an infected or suspected port, or having been in communication with such vessels." After a good deal of conversation, which showed that while some ports had taken many precautions others were not at all prepared to meet an epidemic of cholera, it was determined that a return should be obtained from every port as to the preparations that have been made, notably in reference to

cholera hospital, steam launches, staff, number of ships entering each port &c.

The Conference now began to discuss the all-important question of quarantine, which was defined as the detention of a healthy ship. Mr. Williams stated that at Bridgewater a man belonging to a vessel from an infected port was seized with cholera in a train and travelled many miles in an unconscious condition. Mr. Harris was the only speaker who insisted on the fact that passengers from infected towns could penetrate into the country without entering the Thames or any of the ports where inspection was organised. Dr. Mason insisted on the importance of the second line of defence. A man who had landed from a ship at Hull had been seized an hour after medical inspection, but the second line of defence was ready and in another hour's time he was in the cholera hospital. Dr. Davies proposed and Dr. Mason seconded, "That in the opinion of this Conference quarantine or the detention of a vessel having no sickness on board and so certified by the medical officer of health is unjustifiable."

Dr. Collingridge pointed out that quarantine in the Port of London would mean the detention of 2000 to 4000 persons per week on board ships at the mouth of the river; and, inasmuch as anyone would be able to land at night for half-a-crown, it would be useless. Quarantine might be excellent in theory—it was absurd in practice; and the Conference should emphatically declare, once and for all, that quarantine could not be relied upon and therefore must not be attempted. This advice the Conference followed, for the above resolution declaring quarantine unjustifiable was carried unanimously.

While disapproving of quarantine, the Conference approved the practice of taking the name and addresses of passengers and of the crew, and, to simplify the procedure, voted that these addresses should be communicated direct from the port medical officer to the medical officer of health of the district where the passenger was about to reside. Dr. Collingridge described how, on investigation being made, it was found that, out of a large number of Jew emigrants coming to London, 30 per cent. had given false names and addresses. Several hundred of these Jew emigrants had not been allowed to land, and the ships' companies were obliged to convey them back to Germany, because they were dirty and could not give their addresses. The *Cholera Circular* had very effectively checked the tide of foreign pauper emigration to London. A resolution was passed requiring lodging-house keepers to have a register containing the particulars regarding sailors and others who came from infected or suspected ports.

The question of disinfection was now brought forward, and the discussion showed that the vaguest ideas prevailed on this matter. No one attempted to indicate how a ship should be disinfected. It was acknowledged that the bilge water was too considerable in bulk to be disinfected, and therefore should be pumped out, but the danger of such a practice for inland ports was not touched upon. Nor did anyone venture to describe how the cabins, hold or cargo of a ship were to be disinfected, and nothing was said as to the manner bedding, clothing, furniture, carpets &c. removed from a ship should be treated. There is no general principle governing these operations and every port authority does just what it can or what it likes. The Conference, in the face of this deplorable and dangerous state of affairs, carried a resolution to the effect that "more efficient methods of disinfection be applied," and a committee was elected for the purpose of investigating the entire question.

In respect to hospital accommodation, the necessity of not confusing the general infectious diseases hospital with the special cholera hospital was insisted upon. Several speakers described the difficulty of building cholera hospitals on shore in consequence of the opposition of the population. At Sunderland there had been violent demonstrations against the cholera hospital. Thousands of people gathering together, headed by brass bands, had mobbed the authorities and stoned the medical officer. On the other hand, considerable objection was made to floating hospitals, as these could only be placed on the smooth water of a river, which might easily be contaminated by the patients. Then, again, the amount of accommodation provided in cholera hospitals was not based on any sort of principle and did not correspond with the traffic in the ports or their population. Nor was there at these hospitals or elsewhere the means of giving baths and properly disinfecting the crew and passengers from an infected ship. The Conference voted that it is the duty of the sanitary authorities to provide forthwith proper and special hospital accommodation for the treatment and isolation of cholera cases.

The difficulty of finding the necessary funds to meet all this expenditure was discussed. Under the stress of panic money was forthcoming, but it was more needed beforehand. When the panic begun it would be already too late. At Southampton the cost this year was equal to a twopenny rate and it was doubtful whether the ratepayers would again support such an outlay; at Weymouth and Portland Roads expenses had to be incurred without any compensation. The shipping brought no trade to a port of refuge; it was all cost and no profit. Some ports were extremely poor and yet had to pay for protecting rich inland manufacturing districts from the danger of cholera. The Conference resolved that "Special precautions against cholera, being incurred for the benefit of the entire country, should be defrayed by the Imperial Exchequer."

Dr. Collingridge now explained that the Conference had accomplished the first part of its task, they had come to a common agreement as to what was most needed. The next step would be to invite the sanitary authorities to hold in London a larger conference; and, travelling over the same ground, reaffirm the principles established that day. Then the Local Government Board could be approached by a representation from the entire country; and, by that means, the desired reforms might be obtained. This proposal was adopted. The Conference finally carried a vote of thanks to the Lord Mayor of London; to the chairman, Dr. Collingridge; and to the various port authorities, Custom House Officials &c., who had assisted the Port Medical Officers in their difficult task of warding off the cholera epidemic. In the evening, a number of the members of the Conference dined together at Frascati's Restaurant, and thus terminated a gathering which had lasted, with but brief intervals, for close upon twelve hours.

## THE RUSSIAN CHOLERA CONGRESS.

THE fatality connected with the cholera epidemic which has been raging during the present year, and which, according to official records, has carried off some 280,000 victims, has induced the Zemstvo (local) medical practitioners to hold a Congress at St. Petersburg to discuss various questions in connection with the epidemic, and to devise or suggest measures it would be expedient to adopt in view of its probable appearance next year. No one not personally engaged in the work of combating the disease will be admitted to the Congress. Physicians and reporters for the Russian press will, we are told, form no exception to this rule. An official specially appointed for the purpose will attend the meetings and will receive all the papers from the authors immediately after each has been read. The Congress will assemble on Dec. 25th (new style) and will continue its sittings for a week. The following is an abridged programme of the proceedings:—

On the first day (Sunday) the members will receive the whole of the statistics relating to the epidemic, together with reports on the causes and conditions of the outbreak (illustrated by plans, maps &c.), the measures devised for the sanitation of places of public resort as well as of personal cleanliness. Monday, the 26th, will be devoted to meetings of committees, the demonstration of approved methods of disinfection, the exposition of measures, against the importation of cholera (quarantine, cordons, closing of schools, prevention of extensive migration of the population, overcrowding, provision of reception-rooms for the sick, organisation of registration &c.). On Tuesday, in addition to the committee meetings, the report on measures for combating the epidemic will be discussed, such as the organisation and determination of the amount of medical aid and the appointment of stationary and flying columns, isolation, means to be employed for the proper burial of cholera patients, disinfection &c. The proceedings of the Congress on Wednesday and Thursday will consist chiefly of discussions on reports of committees detailed off to consider the various subjects included in the foregoing programme, which committees will hold a general session on the evening of Thursday and be continued on Friday and Saturday. On Sunday the proceedings of the Congress will close with the usual formality.

## ROYALTY AND HOSPITALS.

## ST. MARY'S HOSPITAL.

ON Saturday last, Dec. 17th, the foundation stone of the new wing of St. Mary's Hospital, Paddington, was laid by His Royal Highness the Prince of Wales. The wing, which is to be called "The Clarence Memorial Wing," will cost when built £100,000, and of this sum one-fifth has already been received. Among the distinguished guests who assisted at this ceremony were the Duke of York, president of the hospital, Princess Maud, the Duke of Fife and the Duke of Cambridge. An address was presented to His Royal Highness which referred to the fact that "the original foundation stone of this hospital was laid forty-seven years ago by your Royal Highness's illustrious father, the first stone of an enlargement was laid twenty years later by your Royal Highness and a further extension was opened by Her Royal Highness Princess Louise, Marchioness of Lorne, in 1883." His Royal Highness, in thanking the governors for the kind welcome they had extended towards him, said he hoped the new site and the new façade would fulfil all local wants. Referring to his son's acceptance of the presidency of the hospital, he said he knew what a satisfaction it was to his son to accept this honour not only on account of the great philanthropic objects of the institution, but to render some debt of gratitude to the distinguished physician, Dr. Broadbent, for the great care with which he had attended him during his long and serious illness of last year. The Prince of Wales then formally laid the stone, after which his Royal Highness presented awards to successful students.

## THE ROYAL EYE HOSPITAL, SOUTHWARK.

ON Thursday, Dec. 15th, His Royal Highness the Duke of York honoured the neighbourhood of the Borough with his presence for the purpose of opening the new Royal Eye Hospital. The imposing ceremony took place within the Surrey Theatre, where there were assembled the Duke of Cambridge, Admiral the Hon. Sir Henry Keppel, the Lord Mayor, the Earl of Kilmorey, the Bishop of Rochester, the Bishop Suffragan of Southwark, Archbishop Vaughan and others. On arriving at the theatre the Duke of York was saluted by the hospital companies of the Volunteer Medical Staff Corps, who formed a guard of honour. Receiving a golden key His Highness inserted it in a model lock electrically connected with the hospital, thus completing the circuit, simultaneously opening the hospital and discharging the signal cannon. A novel feature of the opening of this hospital was an oxygen-hydrogen lantern demonstration of the chief features of the new hospital.

## THE ROYAL VICTORIA HOSPITAL, BOURNEMOUTH.

The Duke of Connaught opened the new wing of this hospital on the 19th inst. An address was presented by the Mayor (Alderman H. Newlyn). His Royal Highness said it had not previously been his good fortune to visit that beautiful and salubrious town; but, like every Englishman, he had heard of it, and congratulated the town on the great strides it was making, and on the popularity it had achieved.

## AN OBJECT LESSON IN GYMNASTIC ANATOMY.

ON Monday, the 12th inst., a lecture on Physical Education was delivered in the Gymnasium of the Royal Military Academy, Woolwich, by Surgeon-Major Deano of the Medical Staff. The lecture, which had been previously given at the Royal Military College, Sandhurst, was in itself well worth listening to, but it excited a good deal of popular interest—as far as the cadets were more especially concerned at any rate—owing to the fact that Sandow, the strong man, was in attendance and afforded in his person a practical illustration of what can be done by physical training in an individual naturally of powerful build—in fact, an object lesson in gymnastic anatomy. The proceedings were under the auspices of Colonel Fox, the inspector of gymnasia at Aldershot, and there was, it need scarcely be added, a full attendance. The lecturer commenced by giving

various instances in ancient, mediæval and modern times of men who were characterised by their superior development of both physical and mental qualities, ending by citing the present Prime Minister, "as not only a man of powerful intellect but as a hewer of trees." He then went on to explain that nature had given us a certain amount of capital or reserve on which we could draw, and added that this might be more clearly represented by assuming that our personal equation was 1. This reserve force was continually being drawn upon, and could only be maintained by good food, sleep and healthy exercise both of mind and body. He pointed out that physical exertion and exercises undertaken for strengthening and developing the muscles were not without exercising a favourable influence also in developing the mind, and among other illustrations remarked that it was commonly recognised that the more exercise a schoolboy took the more fresh and quick he became in his studies. Be this as it may, however,—and in a sense and within limits it is undoubtedly true—the lecturer went on to say that if England was the most athletic nation it was also the worst physically trained one, for young men took up such games as cricket, football, racquets or running, which collectively were very good indeed in their way, but he pointed out that, taking them separately, they all tended to develop only certain parts of the body. In order to avoid this partial development the first thing to be noticed in studying the human frame is, that it is made by nature to stand erect, from which we might infer that all exercises should be performed in that position on the ground on which we stood, and not above it, as in so many of the exercises provided in gymnasia in England. Sandow's development had been attained by constant and systematic use of the muscles, and especially by the employment of 5 lb. dumb-bells, each exercise being designed to increase the power of some particular muscle or group of muscles. Sandow had modelled his system of training on that in fashion with the Greeks and Romans. He had not employed any modern gymnastic apparatus, but had attained his marvellous muscular development mainly by the use of light dumb-bells in connexion with observations on the anatomical arrangement and disposition of his muscles. The lecturer then asked Sandow to perform certain feats and exercises in illustration of what had been advanced. From this point to the conclusion the proceedings became, in a physiological and anatomical sense, very interesting and instructive, for rarely indeed can the various muscles be seen by being put into action in the living body as definitely and precisely as if they had been laid bare by a dissection in a dead one, as was the case in Sandow's exhibition of them. Stripped to the waist, he was able to demonstrate by different movements how great was the command he had over various muscles. Clapping his hands behind his head he was able to make his biceps rise and fall in time to music. Walking round the audience he displayed various muscles in action as they were separately named. By putting his hand behind his back in such a position as to cause contraction of the deltoid he can raise that muscle to a degree that makes the shoulder look out of all proportion to the rest of his body. The development of the flexor and extensor muscles of the upper extremities, especially of the triceps, was also noteworthy. He can flex or bend his wrist to such an extent that a vertical line drawn from the knuckles will fall on the region of the muscles of the forearm. The intimate physiological connexion between the terminal nerves distributed on the skin and those of the muscles beneath, as well as the contractile power of the muscles themselves, are readily manifested; and the normal reflexes should be capable of being easily demonstrated. Sandow applied the hands of some of the bystanders to the skin over the chest walls and other parts of the trunk of his body, with the result that a young fellow described the sensation as being like that of "moving your hand over corrugated iron." Standing in the centre of the room he showed his maximum and minimum chest measurement. After an efforted expiratory act, aided apparently by the pressure of his arms against the ribs laterally, a difference of twelve inches is caused by deep inspiration and forcible action of the inspiratory muscles. When he fully inflates his chest and "sets" its muscles his arms form an angle of about 40° with his body owing to the size and prominence of the muscles under the arm and towards the back of the shoulder and those of the lateral aspect of the chest. The pectoral, and serratus muscles are very noticeable. Taking two packs of cards, together he attempted to tear the two packs—104 cards—in

twain, and after spending about ten minutes in his efforts to do so he succeeded in accomplishing his purpose, affording at the same time an indication of the great muscular strength of the hand and wrist. He failed in doing this at Sandhurst. In order to illustrate the development of the muscles of the back he took a short length of circular indiarubber of about an inch or more in diameter and fitted with handles. This, on being previously passed round the audience, could hardly be stretched by four cadets pulling at each end. Sandow, however, taking hold of the handles and turning his back to the audience, stretched the indiarubber across the back of his neck until his arms were extended at right angles to his body. The action of the muscles of the back caused them to look, as it was remarked, like snakes coiling and uncoiling themselves under his skin. In order to show his weight-lifting power he used a bar-bell weighing 270 lbs., which one of the strongest sergeants of the academy had only succeeded in lifting from the ground by the use of his body as well as his arms. Taking the bar-bell in the centre Sandow allowed it to swing, as it were, by its own weight across his shoulder, from which position he slowly raised it upwards to arm's length above the shoulder. An arrangement was then shown for exercising the adductor muscles of the leg. It consisted of two upright posts and pieces of india-rubber, which are hooked to them and to straps which fasten round the leg just above the knee. The performer sits in a chair between the posts and tries to press the knees together by extending the indiarubber. A cadet who had tried the apparatus could with great effort just do this with three pieces of indiarubber connecting his legs with the posts. Sandow, having attached one more piece of indiarubber on each side, which was all that was available, opened and closed his knees with the utmost ease and without any apparent effort. With the view of showing his gymnastic agility, Sandow very neatly turned a somersault at the close of the performance. His personal equation, as compared with that taken on the previous assumption, may be represented as 50. It is scarcely necessary to add that, with cadets for an audience, Sandow did not lack applause and that there is at present a "great run" on all the light dumb-bells at the Royal Military Academy. The demonstration is, as we have said already, chiefly interesting from an anatomical and physiological point of view, and we have not attempted to discuss the merits of this system from the standpoint of military training and hygiene. The advantages of out-door exercises and sports—in the way of fresh air, emulation, pleasurable excitement and variety—over more systematic and exact methods of physical training need not be stated, for they are obviously on the side of the former.

## COLOUR VISION.

THE report presented to the Royal Society by the Committee on Colour Vision is both interesting and important. The committee held no less than thirty meetings and examined more than 500 individuals as to their colour vision. They also took the evidence of various officials connected with marine and railway work, as well as of several surgeons and experts in testing for colour vision. The results of such an exhaustive inquiry are of the highest importance, and seeing that the conclusions at which the committee arrived have as a natural corollary the framing of certain recommendations with reference to the examination of individuals in whom, for efficient work in their various posts, good colour vision is a necessity, it is to be expected that their labours will have important practical results.

The report deals in the first place with the nature of colour vision, and a short and succinct account is given of the Young-Helmholtz theory of colour vision and of that of Hering. The defects in the ordinary forms of colour blindness are described and also those defects which arise in consequence of disease or injury. The dangers from mistaking signals likely to arise from these defects are pointed out; and while it is stated that no direct evidence had come before the committee showing that accidents on land or water have been conclusively traced to such defects, yet the absence of such conclusive evidence does not disprove the high probability that such accidents have really occurred in

consequence of such defects. It is evident that every colour-blind person employed in certain capacities afloat and on shore must be a source of public danger, and one significant fact is stated showing the probability—that some years ago at least a considerable number of sailors were employed who were defective in their colour vision. The fact referred to is the existence of colour blindness in 4 per cent. of the orphan children of sailors on training ships. As it is well known that colour blindness is to a large extent hereditary, it may be assumed as more than probable that a considerable number of the fathers of these orphans suffered from this defect; and the unsatisfactory nature of the tests officially adopted by the Board of Trade for colour testing of the Marine service does not lessen this probability. It is, however, satisfactory to find that the different tests employed in the Royal Navy are regarded by the committee as most efficient.

The chief recommendations as stated in the letter of Lord Rayleigh, chairman of the committee, are that the Board of Trade or some central authority should schedule certain employments in the mercantile marine and on railways, the filling of which by persons whose vision is defective, either for colour or form, or who are ignorant of the names of colours, would involve danger to life or property, and that the proper testing of all candidates for such employment should be compulsory. This testing should be entrusted to examiners certificated by the central authority, the test to be used for colour vision being that of Holmgren (the sets of wools to be approved by the central authority), and the tests for form those of Snellen. A certificate of the candidate's colour vision and form vision should be given by the examiner, and lists sent annually to the central authority showing the results and stating the nature of the employments for which examinations were held; while rejected candidates may have the right of appeal to an expert approved by the central authority, whose decision should be final. If, however, a candidate whose colour vision is normal is rejected for naming colours wrongly, it is recommended that he should be allowed to be re-examined after a proper interval of time. Re-examination of persons filling the scheduled employments is suggested every third year or oftener, as well as periodical inspection of the tests and the mode of examination at the different testing stations. The committee also recommended that the coloured lights for ships and for lamp signals on the railway should, as far as possible, be uniform, the colours adopted being those of the green and red sealed pattern glasses of the Royal Navy; and that in the case of judicial inquiries regarding collisions or accidents witnesses giving evidence as to the nature or position of coloured signals or lights should themselves be tested for colour and form vision. The immense importance of the subject is evident, and the practical and thorough nature of the suggested measures must recommend them to everyone.

## Public Health and Poor Law.

### LOCAL GOVERNMENT DEPARTMENT.

#### REPORTS OF MEDICAL OFFICERS OF HEALTH.

*Margate Urban District.*—Margate claims a low death-rate for 1891—namely, 11·4 per 1000 of the permanent population. The zymotic rate was also as low as 0·5 per 1000, and since there were no Margate deaths in the sanatorium, which is outside the area of Margate borough, the record is noteworthy. The hospital was, however, systematically used, 63 patients being sent in. The establishment is by no means a satisfactory one, and Mr. Scatliff hopes that some arrangement will soon be made between the several Isle of Thanet authorities to provide themselves with a more suitable set of hospital buildings. Measles is not notifiable in Margate, but its notification is urged on the ground that school restrictions could be utilised to stay the spread of the disease. In connexion with the current sanitary work it is satisfactory to read that all the remaining wells discoverable on private premises, twenty-seven in number, have been closed.

*Leicester Urban District.*—The late Dr. Tomkins commenced this report, and it was completed by Mr. H. J. Blakesley, F.R.C.S. During 1891 the general death-rate was

21·2 per 1000. No case of small-pox occurred last year, but amongst the notified diseases were 794 of scarlet fever, 65 of diphtheria, 178 of enteric fever and no less than 238 of erysipelas. With regard to the latter disease, the opinion has more than once been expressed that, as notification is now utilised in some districts, the system leads to the reporting of much that was never intended to be included under the term "erysipelas." Much information as to current work is given in the report. The local circumstances as to water-supply, common lodging-houses, slaughter-houses and other matters are fully gone into. The dairies, bakehouses &c. are considered in some detail and a number of excellent charts and tables are appended. In fact, the volume concludes a series compiled under the late Dr. Tomkins' supervision and care which any borough may well feel proud to issue.

*Booy Urban District.*—This report deals almost exclusively with questions of disease and vital statistics; but at its close it is stated that regular inspections are maintained, that scavenging is properly carried out and that the question of sewerage is under discussion. According to Dr. John Brown, the general death-rate during 1891 was 21·5 and the zymotic rate 1·5 per 1000 living.

## VITAL STATISTICS.

### HEALTH OF ENGLISH TOWNS.

IN thirty-three of the largest English towns 6125 births and 4046 deaths were registered during the week ending Dec. 17th. The annual rate of mortality in these towns, which had been 18·8 and 19·6 per 1000 in the preceding two weeks, further rose to 20·7 last week. In London the rate was 19·4 per 1000, while it averaged 21·6 in the thirty-two provincial towns. The lowest rates in these towns were 13·5 in Huddersfield, 14·7 in Derby, 15·0 in Portsmouth and 15·5 in Newcastle-upon-Tyne; the highest rates were 27·1 in Sunderland, 27·3 in Brighton, 28·3 in Hull and 35·4 in Bolton. The 4046 deaths included 448 which were referred to the principal zymotic diseases, against numbers increasing from 392 to 444 in the preceding four weeks; of these, 145 resulted from measles, 80 from diphtheria, 80 from whooping-cough, 68 from scarlet fever, 37 from "fever" (principally enteric), 35 from diarrhoea and 3 from small-pox. These diseases caused the lowest death-rates last week in Huddersfield, Wolverhampton, Leeds and Newcastle-upon-Tyne, and the highest rates in Cardiff, Oldham, Bolton, Salford and Brighton. The greatest mortality from measles occurred in West Ham, Manchester, Oldham, Bolton, Hull, Salford and Brighton; from scarlet fever in Bolton, Swansea and Preston; from whooping-cough in Birmingham, Nottingham, Norwich and Salford; and from diarrhoea in Gateshead. The mortality from "fever" showed no marked excess in any of the large towns. The 80 deaths from diphtheria included 59 in London, 3 in Bristol, 3 in Cardiff and 3 in Sheffield. Two fatal cases of small-pox were registered in Oldham and one in London, but not one in any other of the thirty-three large towns; 33 cases of this disease were under treatment in the Metropolitan Asylum Hospitals and not one in the Highgate Small-pox Hospital on Saturday last. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 3621, against numbers declining from 4067 to 3772 on the preceding six Saturdays; 286 new cases were admitted during the week, against 302 and 273 in the previous two weeks. The deaths referred to diseases of the respiratory organs in London, which had fallen from 353 to 339 in the preceding three weeks, rose again to 365 last week, but were 121 below the corrected average. The causes of 101, or 2·5 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Croydon, Cardiff, Bradford, Newcastle-upon-Tyne, and in four other smaller towns; the largest proportions of uncertified deaths were registered in West Ham, Birmingham, Liverpool, Hull and Gateshead.

### HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had increased in the preceding five weeks from 20·6 to 24·5 per 1000, further rose to 25·5 during the week ending Dec. 17th, and exceeded by 4·8 per 1000 the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 13·7 in

Perth and 16·8 in Paisley to 28·1 in Edinburgh and 43·9 in Leith. The 710 deaths in these towns included 87 which were referred to measles, 18 to scarlet fever, 11 to diarrhoea, 10 to diphtheria, 5 to whooping-cough, 5 to "fever," and not one to small-pox. These 136 deaths were equal to an annual rate of 4·9 per 1000, which exceeded by 2·6 the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of measles, which had been 112 and 102 in the preceding two weeks, further declined to 87 last week, of which 26 occurred in Edinburgh and 26 in Glasgow, 17 in Leith, 11 in Dundee and 8 in Aberdeen. The deaths referred to scarlet fever, which had declined from 28 to 13 in the preceding three weeks, rose again to 18 last week, and included 10 in Glasgow, 5 in Leith and 3 in Edinburgh. The fatal cases of diphtheria, which had 2 and 13 in the preceding two weeks, were 10 last week, of which 6 occurred in Glasgow and 2 in Edinburgh. The 5 deaths from "fever" showed a slight further decline from those recorded in recent weeks and included 2 in Edinburgh. Of the 5 fatal cases of whooping-cough 4 occurred in Glasgow. The deaths referred to diseases of the respiratory organs in these towns, which had been 134 and 151 in the preceding two weeks, further rose to 198 last week, but were 48 below the number in the corresponding week of last year, when influenza was fatally prevalent. The causes of 58, or more than 8 per cent., of the deaths in these eight towns last week were not certified.

### HEALTH OF DUBLIN.

The death-rate in Dublin, which had increased from 22·8 to 24·0 per 1000 in the preceding three weeks, further rose to 24·9 during the week ending Dec. 17th. During the first eleven weeks of the current quarter the death-rate in the city averaged 23·4 per 1000, against 18·0 in London and 23·4 in Edinburgh. The 167 deaths in Dublin during the week under notice showed an increase of 6 upon the number in the preceding week, and included 4 which were referred to "fever," 3 to scarlet fever, 2 to diarrhoea, 1 to diphtheria, and not one either to small-pox, measles or whooping-cough. In all, 10 deaths resulted from these principal zymotic diseases, equal to an annual rate of 1·5 per 1000, the zymotic death-rate during the same period being 2·2 in London and 6·7 in Edinburgh. The deaths referred to different kinds of "fever," which had been 4, 6 and 2 in the preceding three weeks, rose again to 4 last week. The 3 fatal cases of scarlet fever exceeded the number recorded in any recent week. The 2 deaths referred to diarrhoea differed but slightly from recent weekly numbers. The 167 deaths registered in Dublin last week included 21 of infants under one year of age and 47 of persons aged upwards of sixty years; the deaths of infants showed a further decline from those recorded in recent weeks, while those of elderly persons showed a further increase. Eight inquest cases and 4 deaths from violence were registered, and 54, or nearly a third, of the deaths occurred in public institutions. The causes of 13, or nearly 8 per cent., of the deaths in the city last week were not certified.

## THE SERVICES.

### MOVEMENTS OF MEDICAL STAFF.

THE following officers have embarked in the *Malabar* for service in India:—Surgeon-Major Asbury, Surgeon-Captains Swan, Winter and Anderson. The following have embarked in the *Euphrates*:—Surgeon-Captains Birrell and Morse. Surgeon-Captain Morris has proceeded in Medical Charge of drafts to Ceylon. Surgeon-Lieutenant-Colonel Finlay has been placed in charge of the recruiting at Hounslow and Brigade-Surgeon-Lieutenant-Colonel McWalters has taken up duty at Portsmouth on return from a tour of foreign service.

### ARMY MEDICAL STAFF.

Surgeon-Major-General J. G. Faught, A.M.S., Principal Medical Officer, Aldershot, having attained the age of sixty, has been placed on retired pay and has accordingly handed over the Medical Administration of the Aldershot Division.

### ARMY MEDICAL RESERVE OF OFFICERS.

Surgeon-Lieutenant-Colonel James Keith Anderson, M.D., 2nd Volunteer Battalion, the Black Watch (Royal Highlanders), to be Surgeon-Lieutenant-Colonel, and Surgeon-

Captain Edward Bass Reckitt, 1st Lincolnshire Volunteer Artillery (Western Division, Royal Artillery), to be Surgeon-Major (both dated Dec. 21st, 1892).

#### INDIA AND INDIAN MEDICAL SERVICE.

Surgeon-Captain J. B. W. Buchanan, Medical Staff, has been transferred from general duty, Mhow District, to general duty, Poona District. Surgeon-Lieutenant-Colonel B. O'Brien, M.D., Civil Surgeon, Agra, on being relieved by Surgeon-Major A. J. Willcocks, will be transferred to the Kheri District. The services of Surgeon-Captain G. B. Irvine, Indian Medical Service (Bengal), have been replaced at the disposal of the Military Department with effect from the date on which he may be relieved of his duties as Officiating Medical Officer of the Meywar Bhil Corps. The services of Surgeon-Captain J. F. Evans, M.B., Bengal Establishment, have been placed at the disposal of the Punjab Government for appointment as Officiating Professor of Chemistry and Toxicology in the Lahore Medical College and Chemical Examiner to the Government of the Punjab during the absence on furlough of Surgeon-Captain D. St. J. D. Grant, or until further orders. Surendra Nath Sirkar, student of the Calcutta Medical College, has been admitted into the Service as an Assistant Surgeon. The services of Third Grade Assistant Surgeon Surendra Nath Sirkar, of the Imperial Establishment, have been placed temporarily at the disposal of the Chief Commissioner, Central Provinces. Surgeon-Major J. Lewtas, M.D., Joint Civil Surgeon of Simla, has been appointed to the Medical Charge of the Army Head-Quarters Staff and establishments remaining at Simla during the winter. Leave has been granted to Brigade-Surgeon-Lieutenant-Colonel H. B. Purves, Civil Surgeon, Howrah (u. p. a.), for two months, without pay; Surgeon-Major K. M. Downie, M.D., 29th Bengal Infantry (p. a.), till April 1st, 1893; Surgeon-Captain D. T. Lane, M.D. (m. c.), for three months; Surgeon-Captain W. H. B. Robinson, 34th Bengal Infantry (m. c.), for three months. The undermentioned Officers have been granted extension of leave:—Surgeon-Major J. C. Marsden, I.M.S., six months (m. c.); Lieutenant W. A. Oswald, I.S.C., six months (m. c.). Surgeon-Captain D. St. J. D. Grant, Professor in the Lahore Medical College and Chemical Examiner to the Government of Punjab, has obtained furlough out of India for two years from Nov. 26th, 1892. Surgeon-Major A. J. Willcocks, M.D., Civil Surgeon, on return from furlough will be posted to the Agra District. Assistant Surgeon Phirozsha Palanjee Mullan, L.M. & S., has been placed on general duty. The undermentioned have passed the lower standard examination in Hindustani:—Surgeon-Captains E. S. Marder, E. C. Freeman, H. E. Winter and G. S. McLaughlin, of the Medical Staff. Surgeon-Captains W. R. Edwards, I.M.S., and A. J. Macnab, I.M.S., have passed the lower standard examination in Pushtu.

#### THE VOLUNTEER OFFICERS' DECORATION.

Among those officers who were presented with this decoration on Monday last by Field-Marshal the Commander-in-Chief were Surgeon-Lieutenant-Colonel Clark of the 4th Middlesex and Surgeon-Lieutenant-Colonel Norton, M.S.C.

#### THE FALL IN THE VALUE OF SILVER.

There is probably no reader of THE LANCET in India who is not more concerned with the depressed state of the silver currency than with any other question at the present time, for it seriously affects all the civil servants and military and medical officers serving in that country. The question is a really serious and urgent one and Mr. Gladstone will be compelled to deal with the problem somehow as soon as Parliament meets. If a further fall takes place in the value of silver the difficulties of the Indian Government will be seriously increased and it will not be at all easy to provide for the interest on loans and for the salaries of Indian officials—political, civil and military. The International Conference at Brussels has been foiled in its attempt to deal with the question and the British Government will certainly have to take it up in Parliament. In the meantime, the loss in the aggregate to medical officers and others serving in India who have to send money home to their families is very considerable.

#### THE PHYSIQUE OF YOUNG OFFICERS.

We would call attention to the account of an interesting demonstration in the way of physical training that has recently been afforded to the cadets of the Royal Military College, Sandhurst, and the Royal Military Academy, Woolwich. No doubt a great deal can be effected by a systematic

course of training and the use of light dumb-bells in strengthening and developing the physique—especially in the case of young men. Out-of-door games will naturally be preferred to in-door exercises and drills and they certainly have the hygienic advantage of fresh air. If these games be severally analysed, however, it will be recognised that for the most part each of them only exercises and strengthens some particular portion of the body and its muscles. The boys of our large schools and young men generally who join in athletic sports rarely, however, confine themselves entirely to one kind, but take part in a variety of games. In so far as physical exercises bring about the *mens sana in corpore sano*, they tend to mental as well as physical robustness; and by inducing a healthy play of the animal functions generally, and of the circulation of the blood in particular, they give rise to a fresh, clear and prompt intellect; but more cannot be got out of the animal machine than goes into it, and if the energy goes off in one direction it will not in another, and a man can hardly undergo great physical and mental work at one and the same time. Notwithstanding much that is said at present it seems to us pretty clear that, speaking generally, the physique of our young officers is very good and quite equal to what it was. In any one of the service clubs in London, for example, a number of young men may be seen of healthy aspect and fine physique. It must be remembered, too, that a man of small but wiry frame frequently displays great energy, activity and endurance, and that men of this type, at the end of an active day's hunting or shooting, or after a march, will often manifest fewer signs of fatigue than others of larger mould.

#### SIR AUCKLAND COLVIN.

There have probably been few men who, on relinquishing high civil office in an Indian province, can look back on their past record with less misgiving than Sir Auckland Colvin; and his work has mainly been in those directions in which sanitarians and members of the medical profession are most interested. He has done all he could in the way of social and humanitarian questions, in organising sanitary measures for the towns and villages of the North-western Provinces, in inaugurating waterworks and drainage schemes for water-logged and fever-stricken districts, in getting hospitals erected and in pushing forward various practical reforms for improving the public health of the province over which he presided. Sir Auckland Colvin was always accessible and could speak to the natives in their own language with perfect fluency; he knew his own mind and also how to express it in terse English, and he had plenty of initiative and energy. His departure from India at the close of his official career is justly regarded as a matter of regret in that country.

#### THE TREATMENT OF YELLOW FEVER BY COLD.

A military surgeon of experience remarked some years ago that in the event of the occurrence of an outbreak of yellow fever on shipboard the best course was to put the ship's head to the northward and to steer there; and he added that if he were himself a sufferer from that disease, he should like to be put into the ice-house, if the ship had one, until he got there. It seems that a Spanish practitioner residing in the island of Cuba has made some experiments in this direction on yellow fever patients by putting them inside a metal-lined box with double walls and top, the intervals between which are filled with ice, by which means the temperature of the inside air is of course greatly reduced and rendered very damp at the same time. Dr. Garcia, who is the experimenter in question, is, according to the *Daily News* in Havana, prosecuting his investigations.

#### THE EFFECT OF MODERN RIFLE FIRE.

Surgeon-Captain Perry Marsh, Medical Staff, in a communication to the *Army and Navy Gazette* of last week, calls attention to the fact that the results of the experiments made by Veterinary-Captain Smith on the bodies of horses with the Lee-Metford rifle bullets are substantially in accord with those which had been already published by himself. There certainly does not appear much room for doubt that to Surgeon-Captain Perry Marsh the credit is due for having first demonstrated the facts. This officer states that he has now collected the reports of a large number of cases in which men have been wounded by the Lee-Metford missile. "My series embraces cases of wounds of various parts of the body at ranges varying from a few inches up to 3000 yards. In not a single instance is there any evidence of extensive disorganisation of the parts by the missile, unless considerable resistance had been offered to its passage by a large compact bone. In all soft parts such as muscle, large

organs and also in expanded cancellous bone. nothing more than a mere clean-cut key-hole wound has resulted. The extent of damage produced entirely depends, as I have repeatedly pointed out, upon the amount of resistance which the bullet meets in its course. For this reason experiments on horses are somewhat unreliable guides in assisting us to form an opinion as to what the destructive effects of the missile are when striking the human body. It should be borne in mind that the large heavy bones of the horse offer a very different degree of resistance to penetration to that offered by the smaller and lighter ones of the human body. Disregard of this fact appears to have been the chief cause in leading Professor Smith astray in his conclusions regarding the damage done by the Lee-Metford bullet when striking the human body at short ranges."

#### THE AGE AND PHYSIQUE OF OUR RECRUITS.

The current number of the *United Service Magazine* contains a contribution under this title by Brigade-Surgeon Staples which many of our readers will peruse with interest in connexion with the late report of Lord Wantage's Committee and the various articles and letters that have appeared on the subject. On the assembly of Parliament the attention of the new Secretary for War, Mr. Campbell-Bannerman, will no doubt be directed to this matter.

## Correspondence.

"Audi alteram partem."

### THE LATE DR. WALSHÉ.

To the Editors of THE LANCET.

SIRS,—The labours of Walshé, and even his methods, belong to a past generation. No one in these days will attempt to rival him in the accuracy or the fullness of his descriptions of the physical signs of disease. Yet at this moment it cannot be without interest to look back some forty years and compare his teaching with ours. In 1854 there appeared the second and, as some think, the best edition of Walshé's "Diseases of the Lungs and Heart," and for precision, lucidity and finish, for concentration without obscurity and a severity of phrase hardly short of pedantry, the book is unique. It appealed especially in its day to thoughtful men, young to practice, who had already discovered a certain vagueness in medicine and were weary of that facile and slipshod style of composition of which Walshé never wrote one line. In numbered paragraphs, section and subsection, with frequent reference to clinical authority, all of his own collecting, Walshé put forth a body of facts, the grammar of his science in such fashion that the book seemed suited rather to be learnt than read. To many a student of thirty years ago Walshé was not merely a text-book, it was his bible. With such a method of work it is no wonder that when Walshé turned from the study of disease in its purely physical aspects, the point of view that alone attracted him, and came to more general discourse as to the look and the manner of his patients his cunning deserted him and he became insipid and uninteresting. He hated general expressions and was so calculating in the saving of words as to write "facies" (p. 403) instead of "face," thinking that the Latin word carried a fuller meaning and might repay the expenditure of two extra letters. Thus Walshé failed where his great contemporary Sir Thomas Watson was supreme. It is curious to note the different bent of the two and the preference of each for his own department. Watson is always easy and picturesque, but the nice description of auscultatory sounds troubled him. "It is a hard thing," he says, speaking of bronchophony and bronchial breathing, "to describe these things in words. Three minutes at the bedside of a patient will put you in possession of them for ever." Three minutes where Walshé expends many pages of small type, while he devotes much time to a sign so comparatively unimportant as egophony, that sound which "does not appear to traverse the stethoscope, but rather to flutter tremulously about the applied

end." And when all is said, the author seems still uneasy lest his description should be too little hedged about with qualification and exception. "I long believed," he writes regretfully, "fine crepitation to be distinctive of pneumonia, but unfortunately in rare instances (I have seen two such within the last year) pure œdema of the lung does give crepitant rhonchus in no point distinguishable from that of pneumonia."

Yet for all his severity the serious reader (and what other could he possibly attract?) cannot fail to see that Walshé has feelings and passions, perhaps even prejudices, like other men. This is shown in his treatment of contemporary writers on his own subject. He differs from Stokes and from Sibson occasionally and with much respect, from Skoda more often and not unwillingly, from Hope always and with joy. So, too, in his phraseology. Careful and well weighed as is every word, there are some words of which his use is peculiar. Thus he habitually writes "infinitely" as though it were the equivalent of "very" and speaks of certain phenomena as "infinitely rare" when his meaning is that they are very uncommon. But it is not for small criticism such as this that I now write. It is rather to point out that the physical examination of the heart and lungs, as Walshé taught and practised it, is hardly understood now in his sense. It was a passion with him, like his love of music and akin to it. It may even be granted that he refined overmuch and that his standard of health was too strict and narrow. That is not the fear now. The art of auscultation is growing old and has passed the age of enthusiasm. But we may well hope that in his declining years Walshé was spared the knowledge that is now taught in some quarters that the terms "bronchial" and "tubular" are much the same, and that a single adjective apiece may suffice to describe the several categories of "crepitant rhonchus."—I am, Sirs, yours faithfully,

Wimpole street, Dec. 22nd, 1892.

OCTAVIUS STURGES.

### NASAL DOUCHE OR NASAL SYRINGE.

To the Editors of THE LANCET.

SIRS,—In the article by Dr. Barr on "Treatment of the Nose and Throat as a source of Middle-Ear Disease: Precautionary Suggestion," every possibility of exciting inflammation within the middle ear is carefully dealt with, and finally in the use of the nasal douche and nasal syringe no less than eight precautionary suggestions are given in great detail. I beg to add one suggestion which will so far as any danger is concerned to the middle ear from nasal douche or nasal syringe embrace all. It is that the nasal douche should never be used, and the patient or nurse should be personally instructed how to employ the nasal syringe effectually and harmlessly. This rule I have rigidly observed since 1874 without a single accident, and I have seldom passed a day when at work without ordering a nasal syringe. I have also endeavoured to enforce this rule in every edition of "Diseases and Injuries of the Ear" and in "Holmes's System of Surgery." It has been necessary to do this, as I am confident from the number of cases I have seen in which the douche has induced inflammation of the middle ear that it is unsafe to trust it in the hands of patients, however carefully instructions as to its use may be given. In again drawing attention to this subject and treating it in so exhaustive a manner, Dr. Barr's article cannot fail to be of great service to many who have not had the opportunities (which he has) of observing the dangers to which he refers. It is altogether futile for anyone to quote in defence of the douche that numbers of persons habitually use it with impunity. This in no sense does away with the undoubted fact that many eventually injure their ears with it. Thus it differs in regard to safety from a properly constructed nasal syringe.

I am, Sirs, yours faithfully,

London, Dec. 20th, 1892.

W. B. DALBY.

### THE PREVENTION OF CHOLERA IN ENGLAND.

To the Editors of THE LANCET.

SIRS,—THE LANCET of Dec. 17th contains a brief and substantially accurate report of a paper which I read on Nov. 21st before the Incorporated Society of Medical Officers of Health. The report, however, states that I questioned whether the "abandonment of quarantine was a wise policy."

I should be sorry for your readers to suppose that I intended to question the wisdom of the abandonment of quarantine in England, and I ask you to allow me to quote the words I used:—"The practical objection to quarantine is that it cannot be effectually carried out. Even in countries which have little commercial spirit, and amongst the inhabitants of which there is no markedly hostile protest against the great loss of time which quarantine naturally causes, it has been found that the system is practically of little or no value in the prevention of the spread of such a disease as cholera. There is little, therefore, to commend the system to us, and the President of the Local Government Board was decidedly right in his decision to decline to adopt it this year in the case of ships coming from infected ports. The wisdom of this decision is, I think, generally admitted. But, if it were not admitted, let us consider for a minute what would happen if a system of quarantine were adopted. This year, it must be remembered, the infected ports were those of Russia and of Germany. Let us suppose that next year those of France were affected. What would happen to our commerce if all communication were cut off from French ports and if passengers from Calais and Boulogne were quarantined? Practically quarantine could not be effectually carried out."

I am, Sirs, yours faithfully,

York-st., Portman-sq., Dec. 10th, 1892.

RICHARD SISLEY.

### "TREATMENT OF OPHTHALMIA AMONGST THE CHILDREN OF THE POOR."

To the Editors of THE LANCET.

SIRS,—My attention has been called to Dr. Jacob's letter in your issue of the 10th inst. That gentleman appears to labour under a complete misapprehension with regard to the steps which have been taken to deal with ophthalmia in some of the London parochial schools. Before entering his "protest" against (what he is pleased to term) "the fashionable system of boxing up a crowd of cachectic children in a special isolation hospital," Dr. Jacob should have made sure of his facts. The confusion in his mind seems to have arisen from the assumption that isolation involves a kind of imprisonment. Since the isolation carried out at the Norwood and Hanwell schools was confided to my hands, I may be permitted to explain to Dr. Jacob the real facts of the case. Most reasonable persons will admit that to allow children with a contagious disease like ophthalmia to have washing and sleeping arrangements in common with unaffected children would be to fly in the face of Providence and court the danger of an extensive epidemic. It may reassure Dr. Jacob to learn, however, that as part of the system, special arrangements have been made for a large amount of outdoor exercise at Hanwell. Every child, for instance, is compelled to walk for two hours each day beyond the precincts of the ophthalmic school. Further, football is compulsory for the boys, while hockey is played energetically by the girls. Dr. Jacob will therefore see that a course of open-air treatment is carried out systematically at Hanwell. The "farinaceous dietary" he so strongly recommends is replaced by a liberal diet-table arranged on a somewhat more comprehensive and scientific basis. So far, then, the ground is to a certain extent common between us. As to the "little local treatment to the conjunctiva," of which Dr. Jacob speaks, I can only say that I have found after a somewhat lengthened experience of the disease that months or even years of systematic care are required to effect a cure in cases of severe trachoma.

Dr. Jacob takes it for granted that affected children are "kept under subjection to all the paraphernalia of green shades, darkened windows, compress bandages &c." Dr. Jacob may be perhaps astonished to learn that no dark room exists at Hanwell, and that the employment of even a shade for the eyes is an event of some rarity. As for compress bandages, such appliances are most unsuited for cases of trachoma, and indeed for conjunctival affections in general. The statement made by Dr. Jacob, that "infectious granular ophthalmia is, *par excellenciam*, the disease of Ireland," will not surprise English readers who have perused his views on the treatment of that affection.—I am, Sirs, yours faithfully,

SYDNEY STEPHENSON, M.B. Edin. &c.

Welbeck-street, W., Dec. 20th, 1892.

### "EXPERIMENTS ON ANIMALS."

To the Editors of THE LANCET.

SIRS,—The question of whether or not the peritoneum of the human being is sensitive or not is not one which can be settled by experiments on animals; and if my views prove to be correct it only affords another illustration of the misleading nature of the experiments I condemn. If there is an error on my part, it of course must be in my erroneous interpretation of phenomena yielded to me by 3300 human peritoneal cavities. But I am collecting evidence on the subject from other surgeons, and I shall send you the conclusions summarised from that evidence when it is complete. I confess at present as I read Dr. Sherrington's letter I can hardly believe that my eyes convey the true meaning of his words, so absurd do they seem to me.

I am, Sirs, yours faithfully,

The Crescent, Birmingham, Dec. 13th, 1892. LAWSON TAIT.

### SUBCUTANEOUS SUTURE OF THE PATELLA.

To the Editors of THE LANCET.

SIRS,—Please permit me to correct a statement in the account of my instruments for bone suture in your issue of Dec. 10th. Dr. D. W. Aitken's instrument described in my paper as a long bradawl perforated at the end is really a tubular bradawl.<sup>1</sup> The perforated instrument was originally described by Ceci of Genoa in the *Deutsche Zeitschrift für Chirurgie*, Bd. xxiii., p. 285. A brief extract of this paper in the *Centralblatt für Chirurgie* for Aug. 14th, 1886, treats it with unmerited contempt and gives a wrong reference to it—viz., Bd. xxxii. instead of Bd. xxxiii.

I am, Sirs, yours truly,

C. B. KIBBLEBY, F.R.C.S. Eng.

Grosvenor-street, W., Dec. 21st, 1892.

### NITROUS OXIDE GAS.

To the Editors of THE LANCET.

SIRS,—It is in the experience of most if not all administrators of nitrous oxide gas to find the gas obstructed during its exit from the bottle, and on the tap being further unscrewed for the gas to rush out sometimes to an uncontrollable extent, blowing off or bursting the india-rubber connexion, causing great annoyance to the administrator and serious alarm to the patient. This obstruction is said to occur when the bottles are in the horizontal position and to prevent it taking place, the late Dr. Sheppard, anaesthetist to Guy's Hospital Dental School, invented an ingenious contrivance. As, however, the cause of this obstruction is not generally known and so easily prevented I venture to state the reason and remedy for it. It is due entirely to a small quantity of water accumulating from several fillings of the bottles the result either of the condensation of moisture from improperly dried gas or introduced in the process of pumping the gas into the bottles. When this water freezes on account of the absorption of heat which takes place during the changing of the liquid gas into the gaseous condition, it forms an effectual barrier to the outward flow of the gas which may suddenly yield as the tap of the bottle is further unscrewed. The remedy is a simple one and is in the hands of the manufacturers of the gas or of those administrators who have their own bottles refilled—namely, taking the precaution to have the taps of empty bottles removed and the water shaken out. I have adopted this plan for two years, during which time I have experienced no inconvenience in administering nitrous oxide gas from bottles placed in the horizontal position.

I am, Sirs, yours truly,

S. EDWARD PEBBLEY, M.R.C.S., L.R.C.P. Lond.,  
Anaesthetist to the National Dental Hospital.

The Terrace, Camberwell, S.E., Dec. 10th, 1892.

### "ON THE DIAGNOSIS OF THE DIFFERENT FORMS OF PROSTATIC ENLARGEMENT."

To the Editors of THE LANCET.

SIRS,—It is allowable to the profession, I presume, to succinctly criticise any article dealing with matters of importance in your valuable journal; at least such have been

<sup>1</sup> Brit. Med. Jour., July 23rd, 1892.

the traditions of THE LANCET. Mr. Mansell Moullin, in writing on the diagnosis of prostatic enlargement, does not as clearly express his meaning as some of his readers would desire; nor does he at all satisfy those who seek for novel or efficient solutions of difficulties in the means he recommends. All his dissertations appear at last to bear upon an invention which, were its practical utility equal to the theory of its rationale, I for one would feel grateful not envious, enlightened not puzzled. "With it the prostatic urethra can be mapped out with perfect accuracy," "and ..... owing to the difference in the resistance presented by the walls, the nature of the growth can be ascertained whether it is soft, nodular" &c. How, may I ask, can such possibly be with an extent of accuracy pointing to utility? We have, firstly, apparently a bulky instrument which, even when closed, is in itself capable of obliterating pro tem. these irregularities it is meant to differentiate, and the expanding sides of the frame of which can only at best (even granting that they can be much expanded) indicate to an extent the diameters of the canal, but not at all unilateral deviation or distinguish anterior from posterior encroachment. Secondly, how can the consistency of the enlargement be told by such means with anything like accuracy? No, Sirs, an instrument which carries out what is really wanted must be based on different principles.

You did me the honour of publishing a description of an automatic urethrometer in your issue of Oct. 10th, 1891, which instrument was lent in June last to Mr. Moullin at this request, and I challenge him now to say it has not given him the ideas which he now tries to apply to the instrument he describes. My perfected instrument, I submit, when bent especially, will, in its withdrawal from the bladder, carry out scientifically the desiderata dwelt upon by Mr. Moullin; for not only will it work automatically, and register to a nicety the resistance of the prostatic walls, but it will draw an outline of their contour.

Mr. Moullin has rewarded me with but scant courtesy for the trouble I took in taking him the instrument, though he promised me "full credit." Nevertheless, I would not now trespass on your space were his instrument to fulfil what is wanted. Finally, will you allow me to suggest that the only manoeuvres of any worth, in my humble opinion, are those of Mercier, and were the beak of his sound hinged on a pervious shaft carrying a wire attached to the beak and in obedience to the operator's hand, whilst recording the extension of the beak, we would, I think, be nearer what is required.

I am, Sirs, your obedient servant,

Crouch-end, Dec. 20th, 1892.

JAMES MACMUNN.

## THE SENATOR JAMES MOLESCHOTT.

(FROM OUR SPECIAL CORRESPONDENT.)

CROWDED to its utmost capacity with students, with medical practitioners and consultants, with the teaching staff of the various schools and institutions, with Senators and members of Parliament and with the fair sex, the Aula Magna of the Roman University offered an imposing spectacle when, at 11.15 A.M. to-day, the Rector, accompanied by Professor Moleschott, the Minister of Public Instruction (Signor Martini), the President of the Chamber of Deputies (Signor Zanardelli), the Dutch, Bavarian and Swiss Ministers, the Prefect, and a long train of the Senatus Academicus and eminent citizens entered and took their seats on the raised platform. To the left of Signor Martini, who presided, stood on a pedestal a very fine bust in bronze of the hero of the day, the formal presentation of which on his having completed his seventieth year was the occasion of the gathering. The sculptor is Ettore Ferrari, and the highly intellectual features of his subject were universally admired as having been given with a fidelity and a life-like animation worthy of both.

When the applause, often repeated, had subsided, Professor Toscani rose and in well-chosen language, in the name of the Faculty of Medicine, presented Professor Moleschott with a parchment signed by 400 brethren in science and teaching, at the same time handing over to him the bust and expressing the hope that it will

long adorn the hall of the institute in which he has taught so indefatigably and so well. This proceeding was followed by the presentation, through Professor Durante and on the part of the Accademia Medica di Roma, of another parchment signed by 200 working practitioners and consultants, to testify their appreciation of Moleschott's scientific work. The third to rise was the Rector of the University, who spoke as an academic colleague in a similar sense, and the fourth was Professor Paliani, Director-General of Hygiene for the kingdom of Italy, a former pupil of Moleschott at Turin, whose medical faculty and accademia he represented. His speech, even more eloquent than those of his precursors, was loudly applauded as he resumed his seat after presenting to Moleschott a numerous signed parchment from the practitioners and teachers of the sub-Alpine capital. After him came M. de Westenberg, Minister of Holland at the Court of the Quirinal, whose discourse was redolent of patriotic pride in the honours done to his distinguished countryman and who concluded by presenting, in the name of the "Dutch Committee for the Moleschott Jubilee," an illuminated address and two fine works of art by his compatriots, Joseph Israel and Alma Tadema. It was now the turn of Professor Colassanti, whose task it was to represent the Dutch Academy of Sciences, the University of Amsterdam, the Dutch Medical Association, the Utrecht Society for the Promotion of Science and Art, the Society of Dutch Rationalists, entitled "De Dageraad," the Institute of Experimental Physiology of Naples and other bodies, and who presented in their name, as well as in those of numerous individuals, a long array of letters and telegrams of congratulation along with a parchment of the Senatus Academicus of Amsterdam, the diploma of honorary membership of the Dutch Medical Association, and a volume published in Moleschott's honour by the "De Dageraad" Society of Rationalists, containing the autographs of many distinguished savants and men of letters, Italian and foreign. Finally, His Excellency Signor Martini, in chaste yet glowing terms, congratulated Professor Moleschott on the auspicious day—a day to which the Italian Government could not remain indifferent—and, on the part of King Humbert, presented him with the *insignia* of the Order of Civil Merit of Savoy.

Prolonged cheering from the upstanding assemblage greeted Professor Moleschott as he rose to make his acknowledgments. In a strain of the manliest, most purely scientific, modesty he dwelt on the magnificent honours that had been conferred upon him, and sought their explanation in the single-hearted devotion to truth that united him to his brother investigators and teachers throughout the world. In a passage of splendid eloquence he pictured himself and his fellow-workers on the great gulf stream of research, following in the deep wake of a mighty vessel—that of inductive science—whose cargo they were ever enriching, but whose port of debarkation they were destined never to see. This image he elaborated with fine effect, till, by an artistic transition, he passed to his own chequered career. In Holland he had imbibed with his mother's milk the love of liberty. His father was a freethinker in the domain of science and instilled into his young mind a passion for work which soon found its highest fruition in daily recurring investigation in the laboratory and the pathological theatre. The lessons he had acquired at the feet of the great physiological chemist, Mulder, he followed up in Germany by acquisitions made in her schools—acquisitions confirmed or modified by intercommunication—aye, even animated controversy—with such pioneers of science as Liebig. It was in Germany that he gained the gentle consort who for twenty years shared his fortunes, his sorrows and his joys, and here he made touching allusion to her tragic and untimely end—self-destruction in a sudden access of mania—in language which went straight to the heart of his audience. His loyalty to truth and to freedom of discussion cost him his chair at Heidelberg; but that loss was made up by Switzerland, the refuge of the patriot, as all Italians understood, which gave him hospitality in the great medical school of Zurich. A few years in the Helvetian Republic enhanced the love he had always borne her as a stranger till, at the instance of the mightiest diplomatist and statesman of the nineteenth century, Camillo Benso di Cavour, he was brought to Turin to throw in his lot with the Italian resurrection and to strengthen her growing energies on the scientific side. Able Ministers of State like Quintino Sella, who asked the Chamber of Deputies to grant—"di urgenza"—the Italian citizenship to the Dutch physiologist, or like de Sanctis, who, after the splendid results of that same physiologist's teaching in the sub-

Alpine capital, transferred him to the University of Rome, vied with men of science and men of letters to make his residence and work in Italy ever more pleasant and more effective, till his citizenship in the land of his adoption was crowned by his having been made one of the Conscript Fathers of the Legislature. These and such-like details, familiar to the student of contemporary scientific history, Professor Moleschott referred to in exquisite Italian idiom, winning the mind and soul as well as the heart of his audience by the manifest care and success with which he had mastered their beautiful language and their noble literature, and confirming by the best of all title-deeds—those of intellectual and moral naturalisation—his right to say of himself, "Civis Romanus Sum."

Seldom have I assisted at a more interesting, a more gratifying demonstration—not the least reassuring feature of which was the splendid physical and mental vigour of its hero, giving earnest of continued work in the laboratory and chair of physiology—for the advancement of medical science and for the rehabilitation of the profession in Italy. At the close of the proceedings the audience, one by one, saluted the "modesto soldato del progresso civile," as he termed himself, on its way out; while all through the day he continued to receive congratulations by telegraph from the chief medical schools of the peninsula, such as Turin, Modena and Bologna.

Rome, Dec. 16th.

## MANCHESTER.

(FROM OUR OWN CORRESPONDENT.)

### *Increase of Small-pox.*

It would appear that after all Manchester is not to escape without closer acquaintance with the scourge which has so long been prevalent in many of the neighbouring towns of Lancashire and Yorkshire. The weekly health return just issued by the Corporation indicates that within the last three weeks more than 40 fresh cases of small-pox have been reported in Manchester, and I hear from another source that on one occasion this week as many as 10 cases were sent to Monsall within a period of twenty-four hours. The distribution of small-pox infection seems to be very general; it is by no means confined to one or two areas, but cases are cropping up, now in one district, now in another, so that a general feeling of uneasiness is beginning to prevail as to whether or not the disease is about to assume epidemic proportions throughout the city generally and thus to become unmanageable. At the monthly meeting of the Manchester Infirmary Board, held on the 19th inst., the subject of small-pox prevalence was specially referred to. Mr. Alfred Simpson, chairman of the Monsall Committee, in moving the adoption of the minutes, said he regretted to have to say that there had been for several weeks past a steady increase in the number of patients received at Monsall Hospital suffering from small-pox. At the present time there were 37 persons in hospital suffering from that disease. The week before 12 were received, last week the admissions were 15, and already this week several others had been admitted. The gravity of the case arose from the fact that 14 out of the 15 patients received last week came from widely separated districts of Manchester, from which it was evident that they would for some time to come have to provide for a distinct epidemic of small-pox. The permanent accommodation at Monsall, from present appearances, would very shortly be exhausted, and it would be necessary to resort to temporary accommodation for any considerable number of cases in excess of the number they now had there. He also added that he had heard with regret from the Hospital Medical Staff the opinion that the population of Manchester at the present time was not well protected from small-pox by vaccination and re-vaccination. Having regard to existing circumstances and to recent experiences in Warrington and elsewhere the action of the Council at their last meeting is greatly to be regretted. The Sanitary Committee, presumably at the instance of the medical officer of health, had carefully elaborated a scheme for the erection of a small-pox hospital on vacant land adjacent to but quite isolated from the present fever hospital at Monsall. The committee presented a very full report giving the reasons which had led them to bring forward their scheme and urging the necessity which undoubtedly existed for promptitude in making provision for the proper isolation

of small-pox. According to local newspaper reports the case advanced by the opposition against the scheme of the committee was a peculiarly weak one; but inasmuch as Monsall is within the district of Newton Heath, an opportunity was afforded to the discontents of that township to make it a grievance that all the small-pox in the city should be sent into their district, some of the representatives going the length of suggesting that each of the several townships of the city—some sixteen in number—should establish a separate hospital for infectious disease in their own districts. It is more than probable that had the debate on the report been kept within reasonable limits, the committee's recommendation would have been confirmed. As it was, however, the discussion was prolonged until after dark, by which time a large portion of the Council had retired, so that when at length the division was taken the proposal of the committee was rejected by a bare majority, the whole matter being referred to the committee for "further consideration and report" some time in January next. From the report of the medical officer of health, which was circulated at the Council meeting, it appears that small-pox is still being treated at Monsall in a couple of pavilions which are in close proximity to the fever wards. The fear though is that infection may spread, as it almost assuredly will do, from the small-pox wards to the other portions of the hospital; in which case both the hospital authorities and the Corporation would incur very serious responsibility, especially since the danger of their present practice has been duly pointed out to them by their medical advisers.

### *The Unemployed and Local Distress.*

There is no doubt that since the advent of somewhat severe weather there has been a good deal of distress in certain districts of the city, and this has been rendered more acute because of the cotton operatives' strike, which unfortunately has not yet come to an end. Most of the boards of guardians and local boards have held meetings to consider the question, but up to the present time there does not appear to have occurred any unusual amount of destitution in consequence of the stoppage of out-door work. The return of comparatively mild weather during the last week has of course greatly improved the circumstances of that portion of the unemployed who are really desirous to obtain work.

Dec. 20th, 1892.

## NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

### *The Newcastle Royal Infirmary and its Management.*

A CORRESPONDENCE of a somewhat acrimonious nature has been going on for some time as to the management of the Royal Infirmary. The fact is the infirmary has at present an advance balance of about £2000, which to some minds would show that it is doing a very large amount of work, but others, acting the part of candid friends, are attacking its management by anonymous letters in our local papers. Now, I am not defending the management of the institution, but I do say that these letters are not fair. If the writers have faults to find with the infirmary let them find it in an open way, declare themselves at the many opportunities presented at the Governors' meeting or openly in the press and then we should know how much weight to attach to their opinions. Above all they should be sure of their facts. This irresponsible letter-writing is calculated to injure a noble institution. It is, however, pleasant to see that one of our large coal companies has sent a donation of £150 and others have followed its example.

### *Ambulance Work in the North.*

The annual meeting of the Middlesbrough centre of the St. John Ambulance Association was held last week. The report showed that, owing to the trade depression in the district, less work had been done during the year than usual; still 258 members had attended a full course of instruction. During the eleven years that they had been working there had been 185 classes with about 5550 members, of whom 4534 had qualified for examination. Surgeon-Major IJutton had also examined a class of seventy-seven at Wynyard Park, the seat of Lord Londonderry, the classes being mostly composed of members of the household. Lady Londonderry and Lady Helen Stewart, amongst others, submitted themselves to examination and highly satisfied the examiner. At Darlington also the members of the Railway

Employés Ambulance Class, instructed by Drs. Middlemiss and Petter, were examined by Dr. Ellerton, of the St. John Ambulance Association, who expressed himself as highly pleased with the results, especially in the bandaging-stretcher exercise.

*Hospital Saturday at West Hartlepool.*

On Saturday last the usual hospital collection was made at West Hartlepool. It is said that the box collection did not exceed the expectations of the committee, but on the other hand Dr. Gourley has had for varded to him several handsome donations in connexion with the scheme.

*How Infectious Diseases are Spread.*

At the meeting of the Chester-le-street Rural Sanitary Authority a case of small-pox was reported. The man had died in the workhouse hospital, having come from Northallerton with a wife and child, who were also suffering from the disease. Small-pox, it is known, has been prevalent in the neighbourhood of Northallerton lately. In connexion with this matter it may be noted that last week a raid was made by the police on tramps and nondescripts found sleeping in coke-yards and cinder-ovens in the county of Durham owing to the frequent fatalities arising therefrom. About sixty-seven tramps are reported to have been arrested. They were brought before a special police court and although a few were discharged the majority were sentenced to imprisonment. They were described as being in a dreadful state from dirt and disease and apparently had not been washed for years. There were two negroes amongst the number.

*A White Seal on the Northumbrian Coast.*

A splendid specimen of the white seal was caught last week in Newbiggin Bay. It was first observed, by some gentlemen who were shooting, making efforts to get out to sea, but it was prevented from doing so by a fisherman stunning it by a stone. It was taken to the village and with difficulty kept alive for a few days. It measured nearly five feet in length and weighed nearly 1 cwt.

*Presentation to Dr. Smellie.*

Dr. Smellie of Jarrow has received a presentation at a meeting presided over by the Mayor of Jarrow. Dr. Smellie has been many years resident in Jarrow, but has received an official appointment in Wigtonshire.

*Memorial to the late Dr. Maclagan of Berwick.*

The Berwick authority have agreed to the erection of a memorial to the late Dr. Maclagan in the High-street, Berwick. Newcastle-on-Tyne, Dec. 21st.

SCOTLAND.

(FROM OUR OWN CORRESPONDENTS.)

*Draft Ordinances by the Scottish Universities Commission.*

DRAFT ordinances bearing in an important manner upon the Faculty of Medicine in the Scottish Universities have just been issued by the Commission. One of these deals with pensions to principals and professors. After ten years' service an annual allowance is granted of twenty-sixtieths of the amount of salary of his office. After ten years one-sixtieth is added for each additional year of service. In calculating the pension, £900 is to be held as the maximum salary of either a principal or professor. The University Court is given power to transfer chairs from one faculty to another and to determine to which faculty new chairs shall belong. The following are briefly the regulations as to the application of Parliamentary grants, as to salaries, and for the institution of a fee fund &c. The Universities of Glasgow, Aberdeen and Edinburgh receive as their respective shares of the annual sum of £42,000, being the Parliamentary grant under the Act of 1889:—Glasgow, £12,180; Aberdeen, £8400; Edinburgh, £15,120. And of the annual sum of £30,000 constituting the Parliamentary grant under the Act of 1892, Glasgow receives £8700, Aberdeen £6000 and Edinburgh £10,800. These sums are ordained to be paid to the University Court of each University. The whole fees payable to the professors in any of the Universities shall be drawn by the University Court and are to be collected in such manner as the Court may from time to time appoint, and shall constitute a fee fund, and the fees so collected are to be kept in

a separate account known as the "fee fund account." It shall also be in the power of the Court to fix from time to time the fees in any of the classes. The sums payable to the professors other than the fees are ordained to be kept in a separate account, to be called the "salaries account." These include endowments and sums paid out of public moneys. The professors and their successors are to receive annually out of the salaries account the respective sums paid into it, and are also to receive from the fee fund such sum as shall bring their salaries in each case up to the amount given in a separate schedule and referred to further on. In the event of a deficiency in the fee fund in any year, the payment shall be diminished proportionally to the normal salary of each professor. In no case is the total salary of a professor to fall below the sum in the second column as under; and if the fee fund is insufficient to make good the minimum salary, the deficiency is to be supplied out of the other funds of the University. Professors appointed to chairs which may hereafter be instituted by the University Court shall receive such salaries and shall have such interest in the fee fund as may be fixed by the Court when the chairs are instituted. Notwithstanding the foregoing provisions, the professors in the University of Edinburgh are during their tenure of office to receive out of the fee fund the full amount of fees drawn from their classes in each year, but under deduction in each case of such sum as may seem to the Court to be just and equitable, not exceeding the average of the sums paid by the professor for the salaries of assistants and class expenses. The medical professors of Glasgow and Aberdeen Universities are to receive during their tenure of office a sum equal to 90 per cent. of the net emoluments of their office, estimated on an average of the five years immediately preceding. Provision is also made for the application of the revenues of the University for expenses of administration, salaries and pensions, the upkeep of buildings, the upkeep and equipment of libraries, museums and laboratories, for the remuneration of lecturers and assistants and of any additional professors who may be appointed. It is further ordained that out of the Parliamentary grants there shall be annually set aside a sum to account of the Pension Fund. The salaries of the principals are set forth as: Glasgow £1100, Aberdeen £800, Edinburgh £1100. The normal and minimum salary in the three Universities in the Faculty of Medicine and specially scheduled are as follows:—

	Glasgow.		Aberdeen.		Edinburgh.	
	£1200	£800	£900	£600	£1400	£800
*Chemistry .....	1200	800	900	600	1400	800
*Physiology .....	1200	800	900	600	1400	800
*Pathology .....	1100	700	900	600	1400	800
*Anatomy .....	800	600	700	500	1000	800
*Natural History .....	800	600	700	500	1000	800
*Botany .....	600	500	500	300	600	500
Medicine .....	600	500	500	300	600	500
Surgery .....	600	500	500	300	600	500
Midwifery .....	600	500	500	300	600	500
Materia Medica .....	600	500	500	300	600	500
Medical Jurisprudence .....	600	500	500	300	600	500
Clinical Surgery .....	600	500	500	300	600	500

The figures in the first columns are what are called the normal salaries of the chairs, those in the second columns the minimum salaries. The six chairs marked with an asterisk are calculated on the ground that the Professors are not engaged in practice.

*Queen Victoria Jubilee Institute for Nurses (Scottish Branch).*

The fourth annual report of this Institute shows that there is an increasing demand for nurses both in Edinburgh and throughout the country. The result is that the home has had to be enlarged by the purchase of additional property. There is now accommodation for twenty-three nurses and further accommodation can be provided when necessary. During the year twenty-seven district probationers had entered the home and twenty nurses had completed their training and received appointments. At the close of the year the council was responsible for thirty-one nurses, of whom six were in the home, thirteen undergoing district training, eight being trained in the Edinburgh Royal Infirmary and the remainder in other hospitals. During the year fourteen new local associations had been formed. During the same period 1969 cases had been nursed and 40,977 visits had been paid. The total ordinary receipts had been £1731 9s. 5d. and the expenditure £1641 1s. 10d. Considerable progress is also reported regarding the pension fund for Queen's nurses in Scotland, which was originated last year by a gift of £500 and now stands at slightly over £800.

*Opening of New Home for Nurses at the Royal Infirmary, Edinburgh.*

In the beginning of the week the new home for nurses at the Royal Infirmary was formally opened. The building contains 121 nurses' rooms, a sick room with six beds and two separate sick rooms, 16 bath rooms and a large recreation room.

*The Health of Leith.*

During the past week the number of deaths in this burgh was 69, making the death-rate 43·82 per 1000. Zymotic diseases caused 23 of the deaths—1 being typhus fever, 5 scarlet fever, 1 diphtheria, 1 erysipelas and 15 measles.

*Aberdeen District Nursing Association.*

The monthly meeting of the executive committee took place recently, when it was reported that during the month from Nov. 14th to Dec. 12th 25 new cases had been entered on the register; 8 patients had recovered, 3 had been removed to the Royal Infirmary, and 6 had died. Number still on register, 23; number of visits paid during the month, 461. A pamphlet drawn up by the Rev. Dr. Danson, describing the working of the Association, is being circulated in Aberdeen.

*Health of Aberdeen.*

Dr. Matthew Hay, in his report for November, says that the death-rate for the month, 23·35 per 1000 per annum, is considerably higher than in the preceding month (19·73). It is, however, lower than in November, 1891, when it was 24·85. The increase is almost entirely due to a higher rate in the older and more densely populated part of the town. This difference is due to several insanitary causes, chief among which is insanitary housing. Dr. Hay urgently recommends an early effort to deal with the recommendations contained in the report by the sanitary inspector and himself, and assures the Town Council that till this is done no decrease in the death-rate can be expected. Dr. Hay reports also one death during the month from influenza, and mentions that he has seen during the past week several cases and has heard of many more. He reminds his readers of the epidemic of last year, when ninety deaths resulted from influenza in four months.

*Draft Medical Ordinances for St. Andrews University.*

The University Commissioners have this week issued ordinances relating to the allocation of chairs between St. Andrews and Dundee, the formation of faculties and fee funds and the establishment of the chairs necessary to complete the Conjoint University School of Medicine. The main provisions of the medical ordinance are similar to those of the other Scottish Universities. The previous ordinance is repealed and the degree of M.D. conferred on practitioners over forty years of age is therefore to be abolished. The new chairs to be established are those of pathology and materia medica, medicine, surgery and midwifery. The Dundee Royal Infirmary is recognised as the official hospital. The arrangements for the constitution of the Conjoint Medical School are not yet complete, no provision having yet been made for the formation of a fee fund in the Medical Faculty as in the case of the faculties of Arts and Science. In these faculties the Commissioners ordain the establishment of a common fee fund for the chairs in both St. Andrews and Dundee as well as a "salaries fund," out of which latter a specified "minimum" salary (£400 to £500) is to be paid. Thereafter the common fee fund (into which the whole of the fees are to be paid) is to be divided proportionally among the occupants of the contributing chairs to bring the gross salary up to a specified "normal" figure, which varies from £500 to £700. The matter of pensions is also dealt with. The total sum to be allocated to St. Andrews University out of public funds is £10,800 per annum, or about one-seventh of the whole amount disbursed to all the Universities. The objects upon which this sum is to be expended are clearly specified and include the endowments of the above-named medical chairs and the equipment required for the Conjoint Medical School. With regard to the curriculum, the first year of medical study (comprising chemistry, physics, zoology and botany) is duplicated and may be taken in either St. Andrews or Dundee. The courses for the remaining four years are to be provided exclusively in Dundee and comprise the chairs of anatomy and physiology in Dundee, along with the new chairs to be instituted, and clinical instruction in the Dundee Infirmary &c. The endowment of the chair of Medicine in St. Andrews

is, on the death or resignation of the present occupant, to be diverted to the foundation of a chair in the Arts Faculty in St. Andrews.

*Dundee Royal Infirmary.*

The appointment of Superintendent of the Infirmary has become vacant owing to the resignation of Dr. M'Cosh. His occupancy of the post, extending over a period of more than seventeen years, has been marked by many improvements of a permanent character, and during his term of office the hospital has been raised to a condition of great efficiency. Dr. M'Cosh is to be entertained at dinner by the medical staff of the hospital and his professional and personal friends prior to his leaving Dundee.

December 21st.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

*General Prisons Board Report.*

THE fourteenth report of the Board of Irish Prisons has now been issued. It treats of local and convict prisons and I desire for the present to refer to the former. The number committed to the larger local prisons during the year ended March last who were wholly illiterate was 11,835, or 32·5 per cent. of the total commitments to those prisons; while the proportion of illiterates of the population, five years old and upwards, in Ireland who could neither read nor write is shown by the census of 1891 to be only 18·4 per cent. The Board again draw attention to the evil of sending persons to prison simply for a few hours, and especially in cases of habitual and frequent offenders, and show that 65 per cent. of the entire number of sentences were for terms of fourteen days or under, while those sentenced to six months or over only represent 3 per cent. of the whole. Since the Board were invested with the management of local prisons in 1878 up to the present, they have reduced the number of bridewells from ninety-five to sixteen, thus lessening in number a class of prisons most of which were altogether unsuitable, both from a sanitary and disciplinary point of view, for the detention of human beings. The average daily number of prisoners in the local prisons during the year was 2506, and the deaths nine, equal to 3·6 per 1000 on the daily average number in custody. The death-rate for the estimated population of the whole of Ireland during the same period was 19·6. There were outbreaks of typhoid fever in four of the local prisons—in Tullamore, Clonmel, Galway and Mountjoy. In Tullamore the outbreak was remarkably sudden, and although very careful investigation was made as to its cause, and a special commission appointed to examine the prison, they could come to no decision. The healthy prisoners were removed to Clonmel and shortly after their transference three of them developed typhoid fever. There has been little change in the number of cases of insanity transferred from local prisons to asylums. The total number was 71, of whom 57 were insane on committal. The board have repeatedly in their reports called attention to the very objectionable practice prevalent throughout the country of committing lunatics to goals instead of sending them direct to the asylums, but they regret to state that little or no improvement has taken place in regard to this matter during the past year. The profit realised on the various descriptions of industrial labour carried on in the several prisons during the year 1891-92 was £2879 11s. 3d., in addition to which there were extra receipts to the amount of £166 10s. 9d.

*Dublin Orthopaedic Hospital.*

The annual meeting which was held last week was presided over by the Lord Chancellor of Ireland. Several improvements have been carried out in this hospital which tend to increase the comfort of the inmates. Two of the wards, for example, have been artistically decorated by the members of the Kyrle Society. During the past year 98 new cases were admitted, which with 18 in hospital give a total of 116 treated within the year. Three deaths took place during the year and only 17 since its foundation, while the number of cases treated in it has reached a total of 1155.

*Clinical Instruction in the Union Hospital and Infirmary, Belfast.*

At the weekly meeting of the Belfast Board of Guardians held on Dec. 13th the Chairman (Sir D. Taylor) reported that

the committee appointed to consider the memorial presented at the last board meeting by the Belfast Medical Students' Association had met that morning and had a long conference on the subject of the memorial with the President of Queen's College, Professor Redfern, Professor Cuming and two representatives of the students, and they approved (one member of committee—a guardian—dissenting) of the following proposals submitted by Dr. Cuming:—“That the hospital and infirmaries of the Belfast Union be opened for clinical instruction in medical science to the students of Queen's College in the following manner and under the following conditions:—1. That the teaching be conducted by three unpaid clinical lecturers—one for medicine, one for surgery, and one for midwifery and the diseases of women, together with such of the medical officers of the union as may be willing to and may be appointed to act in conjunction with the clinical lecturers. 2. Each of the clinical lecturers to have placed under his care forty patients, selected from among those admitted to the hospitals and infirmaries. 3. The clinical lecturers to be responsible to the Board of Guardians and to the Local Government Board for the treatment of the patients so placed under their care, and to conform to such regulations as may be laid down for their guidance. 4. No patient to be placed in the clinical wards or retained in them contrary to his expressed wish, and no patient to remain in the clinical wards longer than the clinical lecturer shall deem advisable. 5. The clinical lecturers to be responsible to the Board of Guardians for the maintenance of due order during the period allotted to clinical instruction. 6. The regulations for clinical instruction and the nomination of clinical lecturers to be made by the Council of the Queen's College, subject to the approval of the Board of Guardians.” A long discussion followed, in which, amongst other matters, it was stated that the union workhouse in Cork and other places were open for the purpose of clinical instruction to medical students, and that the Royal University recognised the certificates issued from these institutions. Finally, it was decided by a large majority (23 to 13) that the foregoing proposals be adopted and entered on the minutes, and that the Local Government Board be requested to sanction them.

#### *The Belfast Health Society.*

On Thursday, Dec. 15th, a meeting was held at Queen's College, Belfast, to inaugurate a Health Society in Belfast. Dr. H. O'Neill, having spoken of the high death-rate of Belfast, said the object of this new Belfast Health Society would be to draw the attention of the public to the laws of health by means of popular lectures, publishing of leaflets and by giving assistance to the constituted authorities in the detection of insanitary conditions, as well as by the promotion of sanitary improvements. Dr. Whitaker, medical officer of health, and Dr. Graham, chairman of the Public Health Committee, were present. It was decided to form such a society and to appoint the Rev. Dr. Hamilton, President of Queen's College, first President of the Society, Dr. O'Neill secretary, and Sir James Henslett treasurer.

#### *Belfast Dispensary Committee.*

At a meeting of this committee, held on Dec. 19th, it was decided to reapportion the districts and to create two new ones. For some time it has been felt that the medical officers have now too much to do, and the present rearrangement will serve to relieve them.

A subscription ball in aid of the funds of Mercer's Hospital was held last week at the Rotunda and proved most successful.

Dr. Gijsani has been elected visiting physician to Cork Workhouse. There were four candidates for the post.

December 21st, 1892.

(FROM OUR OWN CORRESPONDENT.)

#### *A Medical Martyr.*

AMONGST the victims to the late cholera epidemic at Havre was a *confrère*, Dr. Piesacki, who, dying at his post, left a penniless widow to mourn her loss and to support six members of the family. The Société de Protection des Victimes du Devoir Médical has come to the poor lady's aid by voting her a

sum of 1000 francs together with an annual income of 200 francs. It has also been resolved to further her application for a grant of a tobacconist's shop. This may seem strange to English readers, but the privilege of vending the fragrant weed, which is in the gift of the Government, is much coveted. It is, as a rule, given to the widows or poor female relatives of soldiers or functionaries who die in the service of their country. The position is one to which no kind of humiliation is attached in France.

#### *Posthumous Honours.*

This is the time of year when scientific prizes are awarded by the various Societies of Paris. Last year I had the pleasure of recording the name of our distinguished compatriot Dr. (now Sir Frederick) Bateman of Norwich in this connexion. This year a diligent perusal of the prize-list of the Académie de Médecine fails to discover an English name, and yet the list is a very long one. The Leconte prize of the Académie des Sciences, of the substantial value of 50,000 francs (£2000), has been allotted to the work of the late Dr. Villemin, who will be known to posterity as the discoverer of the infectious and transmissible nature of tuberculosis. M. Pasteur, in presenting the report of the Prize Committee, said that few discoveries had influenced medical thought to such a degree as that with which Villemin's name will for ever be associated. This honour, continued M. Pasteur, must be counted for Villemin *le premier hommage de la postérité*.

#### *Ward Boheos.*

Professor Guyon never tires of emphasising the necessity of frequent catheterisations for the subjects of prostatic hypertrophy. This is the only way of preventing stagnation of urine and its corollary increase of tension of the bladder walls—the two dangers *par excellence* to be avoided in such cases. Hypertension induces congestion and the experiments of M. Reblaud show that congestion favours microbial infection, not only of the bladder itself, but of the ureters and renal pelvis. Even when the bladder is already infected repeated catheterism is the best safeguard against ascending pyelo-nephritis. One of Professor Guyon's patients had practised hourly catheterism without regard to antiseptic precautions for a period of twenty-six years, with the result that, although the bladder became infected the kidney remained healthy, and the “prostatic” lived to the age of 102 years. M. Guyon reminds us that the sensation of the *besoin d'uriner* becomes frequently dulled in these patients, and that consequently this must not be waited for before passing the catheter.

Dr. Legroux of the Trousseau (Children's) Hospital often draws attention to the significance of abdominal pain and vomiting in little girls affected with vulvitis. Such symptoms reveal the presence of peritonitis due to the penetration of the microbes of the vulvar pus into the peritoneal cavity via the uterus and the Fallopian tubes. In one such case which terminated fatally there were found post mortem a collection of pus in one of the tubes and numerous peritoneal adhesions in the pelvis. According to the same clinician a valuable sign of anæmia of a grave character may be discovered on auscultating the globe of the eye. In this disease, when the ear is applied to a flexible stethoscope placed over the globe covered by the upper eyelid, a *souffle* analogous to that heard in the neck and over the vessels of the limbs may be easily distinguished.

December 21st, 1892.

## BERLIN.

(FROM OUR OWN CORRESPONDENT.)

#### *The Cholera.*

A MEMORIAL concerning the recent cholera epidemic has been laid before the Federal Council of the German Empire. It treats of the development of the epidemic, the measures taken against it, and its influence on international traffic. It contains the following: “The cholera is now as good as extinct in Germany. During November only isolated cases were reported. It is in Russia that the situation is still most grave; especially in the south and south-west of Russia many cases and deaths have occurred within the last weeks. In Livonia also the epidemic has spread to noteworthy dimensions. In Poland, especially in the districts of Radom, Siedlec and Lublin, it is by no means extinct; on the con-

trary, it seriously threatens the Prussian parts of the basins of the Niemen and the Vistula from there. Though the cholera may be regarded as vanquished for the present in Germany, and is also likely to be kept away from our frontiers by the measures taken during the coming winter, the danger of an epidemic in 1893 is not to be underrated. The experience of former epidemics is that, whenever cholera has penetrated into the basin of the Volga, it has generally abated in Russia during the cold season, but not quite ceased. Isolated cases generally occurred during the whole winter, became more numerous in spring, and produced new epidemics. The first cases of cholera which were of special importance for the prevention of an epidemic, had often, owing to the slightness of the symptoms, remained quite unnoticed. In view of this, the Minister points out the necessity of the bacteriological examination of the contents of the small intestine in all cases in which there is a suspicion of cholera. It is therefore urgently to be recommended, with a view to the rapid determination of the disease, that adequate material for investigation be at once sent to the nearest university institute provided with the requisite apparatus, or to the Imperial Office of Health, where a reliable decision will be promptly arrived at." The obvious objection to this is that the place where the suspicious case occurs may be very distant from any such institute. The cholera epidemic in Russian Poland is rapidly on the decrease.

#### *Professor Virchow on Cremation.*

Professor Virchow addressed the following letter to the Cremation Society in the early part of this month:—"In answer to your favour of the beginning of October, in which the board requested me to give my opinion of the utility of the introduction of optional cremation, especially in the case of persons dying of cholera or other epidemic diseases, I have to state that I adhere to the opinion expressed by me in the Prussian Landtag in 1881, and regard cremation as absolutely useful both from the sanitary and from the politico-economical point of view. For large cities especially, cremation is to be striven for, as burials *en masse* in cemeteries often immediately adjacent to inhabited districts reawaken apprehensions of danger."

#### *Heat Apoplexy in the Prussian Army.*

The number of cases of heat apoplexy in the Prussian army between March 31st and Oct. 1st, 1892, was 198, the number of deaths from this cause 11. The corresponding numbers in 1891 were 121 and 6. The increase was due to the great heat this year during the autumn manoeuvres.

#### *The Chicago Exhibition.*

Sanitary Counsellor Dr. Oldendorff of Berlin has been appointed a member of the committee of the Section of Medical Climatology of the International Medical Congress connected with the Chicago Exhibition.

#### *Paul Niemeyer.*

The friends and pupils of the late sanitary councillor Dr. Paul Niemeyer, the founder of the Hygienic Society, have erected a monument of him on his grave at Rixdorf, one of the southern suburbs of Berlin.

## VIENNA.

(FROM OUR OWN CORRESPONDENT.)

#### *Cholera in Austria-Hungary.*

THERE is now only the district of Husiatyn on the Russian frontier whence cases of cholera have been reported since Nov. 15th last; even this week two new cases occurred there. But other parts of Galicia and the other Austrian provinces have remained free from cholera. In the neighbouring parts of Russia the disease is raging very severely, especially in Podolia, and according to private and confidential reports received at Budapest, recent severe outbreaks of cholera have been notified in the southern provinces of Russia and at Batum. In Hungary the number of cholera cases decreased considerably during last month, and at Budapest, where 665 cases of cholera with 368 deaths were reported in October, only 188 cases with 111 deaths were recorded in November. Isolated cases only are occurring now at Budapest and in the provincial districts of Hungary and the measures

directed against the spread of the epidemic have been abandoned by the Government.

#### *The Poison of Egg Albumen.*

In a previous letter to THE LANCET I reported that Professor Gruber of Vienna had prepared a poisonous substance from fresh egg albumen by treating it with water and alcohol. Further researches made by Professor Gruber revealed the fact that the poisonous action produced by the extract was due to the alcohols and to sulphide of hydrogen present in the albuminous liquid.

#### *Poisoning by Corrosive Sublimata.*

At a recent meeting of the Vienna Medical Society Professor Albert gave an account of an interesting observation made on himself. For two years he had suffered from dyspeptic troubles, the cause of which he could not at first discover. At the same time he observed that his finger-nails became softer and that two apparently healthy teeth were falling out spontaneously. He recently came to the conclusion that these symptoms might be due to poisoning by corrosive sublimate which he as a surgeon had to use daily. This view has now proved to be correct by an analysis of his urine, made at the Chemical Institute, a considerable quantity of iodide of mercury being obtained from it. His case should prove a warning to surgeons to be careful in using the sublimate, which seems to be easily absorbed by apparently healthy skin.

#### *The Use of the Galvanic Current for the Examination of the Urine, Sputum &c.*

Two Vienna physicians have recently used the galvanic current instead of the *centrifuges* now so much in use for producing deposition. The method is based on the same principle as that devised by Webster for the electrical treatment of sewage. By the electrolytic action of weak galvanic currents the gas-bubbles formed in the liquid carry with them the formed elements—cells, bacteria, even crystals—to the surface, whence they may be easily removed for microscopic examination &c.

## NEW ZEALAND.

(FROM OUR OWN CORRESPONDENT.)

#### *The Sanitary Condition of Wellington.*

On the evening of Sept. 14th a public meeting of vast importance to the inhabitants of the Empire City was held in the Opera House to consider the proposal of the City Council that a special loan should be raised for the purpose of carrying out an efficient system of drainage. This gathering has not met a moment too soon. There was a large attendance and great interest was taken in the proceedings generally. Mr. H. Bell, the Mayor of Wellington, presided and the seats on the stage were occupied by some of the leading citizens. The sum proposed to be borrowed for drainage purposes is £165,000. The Mayor proposed, after an introductory speech, the following resolution:—"That this meeting approves of the proposals of the City Council set forth in the public notice thereof as advertised." Mr. Bell drew attention to the present drainage of the city, showing that with the exception of a small part of it lying to the south of Newtown Ridge all the sewage of the city is discharged into the harbour. As a result the shores are silted up with the refuse of filth of a growing population. The watercourses have been converted into sewers and polluted. Their beds are therefore a fitting nest for the propagation of germs of all kinds of diseases. The existing system of box drains which constitute the main sewers—where there are no natural watercourses—are necessarily made large enough to carry flood water as well as the ordinary surface water sewage. The result is then that we get great spaces in these boxes where sewer air is constantly present and where "fever germs" can breed under exceptionally favourable surroundings. Furthermore, it must be remembered that a considerable part of the Te Aro end of the city consists of swamp land, in which the drains have sunk and are bent in such a manner as to leave "escapes" at many spots for the dangerous gases. To show that the condition of things is not on the mend and that something radical must shortly be done it is only necessary to quote the number of deaths from zymotic disease as shown by the

Registrar-General's report for the last six years. It is as follows:—

Year.	Under Five Years.	Over Five Years.	Totals.
1886	30	38	68
1886	68	22	85
1887	68	26	89
1888	30	25	55
1889	49	26	75
1890	43	34	77
1891	55	46	104

How is the remedy to be applied? Since Wellington or a large part of it lies on a flat and is surrounded by hills, to deliver the sewage of that flat into any other place but the harbour it must be lifted up. This can be accomplished by pumping, so that the sewage can be delivered into Cook's Straits. Now various plans have been suggested to engineers from time to time to accomplish this end. Sixteen years ago Mr. Clinic was instructed to furnish plans &c. by the then existing City Council for a system of sewerage for 50,000 persons. Since then numerous other plans have from time to time been submitted, but for various reasons no definite step has been taken one way or the other. The City Council in 1890—much to their credit—having determined that the city should be cleansed, and having before them several schemes for effecting this purpose, proceeded to appoint a commission of independent experts—first, to examine the several schemes already sent in; and, secondly, to advise the Council generally as to the best means of draining the city. Admittedly two of the most eminent engineers in the colony were appointed, Messrs. Ferguson and Cuthbert. The further taxation which these loan proposals will involve is really of very little importance. It being settled that the city must be cleansed, it follows that the expenditure is like the doctor's bill—you cannot stop to count the cost. It is a matter of life and death. After all the additional rating will not be found to be excessive, for it will amount to 4½d. in the pound, and this will gradually grow less. An amendment to the Mayor's address was introduced by Mr. MacDonald, "That the citizens of Wellington are not in favour of raising a loan under the Wellington City Sanitation Loan Empowering Act of 1892 until Parliament has passed an Act vesting the expenditure of any moneys raised under the provisions of the Act in a drainage board." A very lengthy discussion ensued, and finally the resolution was put to the meeting and on a show of hands was declared carried by a majority of about two to one. However, on the evening of Sept. 24th an opposition mass meeting was called by advertisement to consider what action should be taken regarding the poll of ratepayers in connexion with the borrowing of this sum of £165,000. Several speakers insisted that a special drainage board should be elected and the following resolution was put: "That this meeting is strongly of opinion that to entrust the City Council with the uncontrolled expenditure of £165,000 for drainage purposes would be highly imprudent, and the meeting pledges itself to vote against the loan proposals and not to support any large expenditure of money for drainage until a duly constituted drainage board has been formed to deal with the complete sanitation of the city of Wellington." The proposition was ultimately put, and on a show of hands being taken about half a dozen hands were held up in opposition, the meeting (consisting of about 700 persons) being practically unanimous in support of the resolution. The effect of these two meetings was that the whole subject was left to the decision of the body of ratepayers, the result being that the ratepayers by a most substantial majority decided to accept the drainage scheme and to furnish the means for the same. I am glad to note that there was no difference of opinion as to the scheme generally and I sincerely trust that now we shall soon see Wellington emerge from the dark cloud of insanitary scandal which has for so many years surrounded it.

**DEATH OF A MEDICAL CORONER.**—The death is announced of Mr. W. Webber Munceton, M.R.C.S., for nearly forty years Coroner for the Western Division of Somerset. His failing strength—he was seventy-four years of age—had rendered it necessary of late that the duties of the office should be carried on by his deputy, Dr. Cordwent of Taunton.

## Obituary.

SIR RICHARD OWEN, K. C. B., F. R. S., F. R. C. S. ENG. (HON.).

AFTER a life of strenuous labour the giant constitution of Professor Owen has at last succumbed, after a conflict with Death in which every inch has been stoutly contested. Born at Lancaster on July 20th, 1804, Owen's remarkable vitality has only failed when his ninetieth year was almost within hail. And it has been a life full of work, full—too full, perhaps—of controversy, and yet full of much happiness at home, among friends, and abroad. The bitterness of death, in his case, fell on him thrice—when, in 1873, he lost his wife; his attached sister, who for many years kept his house; and his only son. As to all who live to a great age, there came, too, the grief of losing all or nearly all with whom he had lived or worked, chief of all of whom was Edwin Chadwick. Almost contemporaneous with Owen there worked in various countries of Europe great zoological pioneers. Of these, Henri Milne-Edwards of Paris and Carl Theodor von Siebold of Munich preceded him, but Sven Loven of Stockholm and P. J. van Beneden of Louvain are left to mourn him.

The great age to which Owen lived may be measured by remembering that he was the pupil of Cuvier; that he was addressed in terms of admiration of his "father's" work by Oken, who did not recognise in the youthful Englishman an already famous zoologist; and that he was assistant to Charles Bell when the last named was Professor at the College of Surgeons of England. United by ties of marriage with Clift, he was almost brought into touch with John Hunter, the great object of his veneration. Before his eyes Darwin rose to his great pre-eminence, and he watched with interest the whole of the career of Francis Balfour, only too soon lost to science. Princes now of middle age were his pupils. It was by Sir Robert Peel that he was first placed on the Civil List, and for forty years he occupied the charming cottage in Richmond Park, which he owed to the favour of his Sovereign. A life of such extent would, with an ordinary worker, result in a considerable accumulation of books and memoirs; but Owen was more than an ordinary worker; rising early, he did several hours' writing before attending his office in Lincoln's-inn-fields or the British Museum. Better than most men he knew how to rid himself of untimely visitors, and he gave less time than many give to affairs of business outside their own walk in life. The result is to be seen in his catalogue of the Hunterian Museum, which extends over ten quarto volumes; his three volumes on the Anatomy of Vertebrates; and his treatise on Odontology, illustrated by more than 150 plates. Some of the numerous memoirs which he communicated to learned societies have since been collected into separate volumes; those on British fossil reptiles fill four quartos, and the twenty-five memoirs on the fossil birds of New Zealand form another handsome volume. Five memoirs were devoted to the osteology of marsupials, while the extinct mammals of Australia and the reptiles of South Africa were very copiously dealt with. He did not, however, as many do now, confine himself to one group of the animal kingdom; the once rare sponge, now so common a drawing-room object, was first described by him and appropriately called "Euplectella." Having his attention called "by an intelligent student of the name of Paget" to a deposit in human muscle, he was the first to give a systematic zoological description of the now well-known Trichina. Of nearly every animal of importance or interest he made early, if not the first, dissections. On the nautilus he wrote a memoir which is still classical and is most beautifully illustrated; he dissected its rare zoological ally, the Spirula, and the Argonaut, with its delicate shell. The apteryx, the dodo, the giraffe, the gorilla, have all had Owen among their historians. And with what charm are many of these histories told, for if Owen disliked the speculations of the modern school he was always on the look out for an opportunity to generalise. Some of these generalisations are now universally accepted, others are still in doubt; one suspicion has been only recently shown to have been justified; others, again, have been shown

to be based on insufficient knowledge or inaccurate observation.

It is striking that the most important general doctrine which Owen was the first to teach has been of considerable service in the exposition of the theory of evolution. Till he pointed out the difference no distinction was made between organs that performed the same duties and organs that had the same structure; both were called analogous organs. He, however, distinguished as analogous those that, like the wings of butterflies, bats and birds, served the same purpose, from those that are homologous, or, like the wings of birds and bats, the arm of man or the forefoot of the horse are formed on the same plan. It is clear that when the question was asked, Why are homologous organs made in the same way? an obvious answer (if not, indeed, the right answer) is because they are descended from an organ common to them all.

The whole of Owen's long working life was chiefly spent in two institutions only. After receiving his medical education at Edinburgh he was for a short time connected with St. Bartholomew's Hospital; selected as an assistant to Clift in 1828, he became in time Conservator of the Hunterian Museum, and held that office till 1856; from 1834 he was for twenty-two years Hunterian Professor, and his lectures attracted large audiences and the most select of the intellectual society in London. From 1856 to 1884 he was superintendent of the natural history departments of the British Museum. His official energy in this post was largely directed to the extension of the galleries devoted to natural history. He early found an ardent supporter in Mr. Gladstone, and there can be no doubt that Owen never forgave Mr. Disraeli for delaying by an adroit speech and skilfully caught votes the building of the new museum at South Kensington. In 1882 and 1883 Owen had the satisfaction of seeing the building open to the public, and the treasures from Bloomsbury brought safe to their new home. His strength, however, was beginning to fail, and early in 1884 he resigned his office. He could now say with Dido:

"Urben præclaram statui; mea mœnia vidi,"

and the time for beginning to rest had come. For some years he was connected with the Royal Institution as Fullerian Professor. As has already been said, Owen did not busy himself much with a share in affairs. He was of course for many years to all practical purposes the unpaid prospector of the Zoological Society, but he found his reward in the dissection of the animals. He made numerous reports to the British Association, but they were reports of investigations. In 1857 he was president of that learned body and he was the first president of the Microscopical Society, in the institution of which he took some interest. He was thrice a member of a Royal Commission when the questions of public health and meat supply were under consideration.

Of the world's honours he had his share. Made a C.B. in 1873, he became a K.C.B. on his retirement from the British Museum; the Sovereigns of Italy and of Brazil conferred distinctions on him; he belonged to the Prussian "Ordre pour le Mérite" and four years later (1855) he entered the French "Legion d'Honneur." He received the Royal medal before he was forty years of age and the Copley medal in 1846; he was an Honorary Fellow of the Royal Colleges of Surgeons, both of England and Ireland.

Richard Owen lived so long that his many great services to science stand in danger of being forgotten by the present generation, who knew him better as the pungent controversialist of the year that followed the publication of the "Origin of Species." It is true, indeed, that Owen was not seen at his best in controversy; to those who knew him at home, who were privileged to saunter with him in the beautiful garden behind his little cottage, this was a matter for wonder no less than regret. Wonder, because his love of nature was so intense that one thought it must have been the mistress of all his actions; and regret, because his nature was so affectionate, his manner was so engaging, and his conversation so delightful, that none ever came into familiar contact with him but cherished for him a profound regard. The manner which endeared him to his Queen and her family, the ability which gave him a place in that most select of coteries, "The Club," the social flexibility which made him at home with men of all professions were as much at the services of the least known of his friends as at the command of a princess. Those who knew him at home will always cherish the recollection of a nature essentially happy, grateful for kindness, and anxious to please and serve those with whom he was glad to associate.

SAMUEL DUKINFIELD DARBISHIRE, M.D. Oxon.,  
M.R.C.S.

To a small number who were aware of the long period of illness through which he had passed the announcement in *The Times* of the death of Dr. S. D. Darbishire came as no surprise, but there must be a very large number of his associates at the University and in the medical profession who will lament with deep sorrow the early loss of one who had throughout his life endeared himself to all with whom he was brought in contact. Born at Manchester in 1846, he was educated privately until he matriculated at Balliol in 1866. His father was a respected and prosperous merchant, and Samuel Dukinfield was the seventh son. His early days were for the most part spent at his father's country seat, Pen Dyffryn, near Penmaenmawr, where he became an expert and powerful swimmer, and formed friendships with many of those, older and younger, with whom his mother took pleasure in filling her large and hospitable mansion amongst the hills of North Wales. Soon after going to Oxford he showed his talent for rowing and was made stroke of the Balliol eight. At that time the Balliol boat was very low on the river, but under his auspices it soon began to make "bumps" and to gain a higher place. In 1868 he first stroked the Oxford eight in the race at Putney against Cambridge. Supported by a powerful crew he secured for his University the eighth consecutive victory against her rivals and in the following year he again repeated his success, but in 1870 his crew were beaten at Putney. The most notable event, however, in his career as an oarsman was the race which was rowed from Putney to Mortlake, on Aug. 27th, 1869, against a four of Harvard University. The Americans had sent a challenge to Oxford, which was readily accepted, although there was some difficulty in arranging the match owing to the time of year at which the Americans preferred to row. At length, however, a crew was found which contained perhaps the four most powerful and finished oarsmen that ever sat in a boat together. Of these Darbishire, who rowed stroke, was the lightest member of the crew, weighing 11st. 8lb. The Americans dashed off with a lead but were soon overtaken, and the Oxford crew had an easy task and finished the distance in 22 min. 28 sec. The following extracts from his letter to Dr. Morgan, published in "University Oars," are of interest at the present moment. Writing in 1869, he says: "As to myself, I can confidently say that the rowing and training have done me a great deal of good. I have always been very well during training and the more I row and train the stronger and healthier I seem to get. If my testimony is of any weight I can assure you that as far as my experience goes the 'Varsity Race' and the training for it is not injurious; but it is when men row continually in races, both in training and out, or when they keep in training too long or break it too suddenly, that they injure themselves." In the three years that he stroked the 'Varsity boat his weight was, in 1868, 11st. 3lb., in 1869 11st. 9lb., in 1870 11st. 11lb. He took his arts degree in 1870 and soon afterwards entered as a student of St. Bartholomew's Hospital. He became M.R.C.S. in 1876 and was house surgeon to Mr. Callender and subsequently house physician. He then went abroad and studied at Tübingen and Vienna. On his return he worked in the out-patient rooms of the Hospital for Sick Children, Great Ormond-street. He took the M.D. of Oxford in 1883, and besides two papers published in St. Bartholomew's Hospital Reports wrote a Lecture on Recreation in the publications of the International Health Exhibition. At one period he got together materials for a contemplated paper on the action of muscles in rowing, but this was unfortunately never published. After his marriage he settled in general practice in Addison-road, Kensington, but a few years later he bought the practice of Dr. Giles in Oxford and settled in the house vacated by that gentleman in the High-street, near Magdalen College. He was elected to the staff of the Radcliffe Infirmary, of which at the time of his death he was the senior physician. A vacancy occurring in the office of University Coroner, his candidature was supported by a very large number of friends, and after an unusually large poll he was elected to the office. He became an Examiner in Medicine for the University and a member of the Board of Faculty of Medicine. He was also the local secretary of the Oxford Graduates' Medical Club, and

besides fulfilling all these duties found leisure for the congenial work of coaching the University and other crews. Not long after taking up his residence in Oxford his health began to fail and he became very emaciated and worn. After consulting two or three London physicians he went to St. Thomas's Home, where he improved to a certain extent; but the symptoms, which were mainly attributable to some nerve disorder, became more aggravated, and he went abroad, but returned greatly reduced in health, and died under the shadow of the hills where his boyhood had been passed.

#### JAMES H. AVELING, M.D. ABERD.

IT is with regret that we have to record the death of Dr. Aveling, who, as an obstetrician as well as a gynaecologist, was an earnest worker in the department of practice to which he had devoted himself. As an example of his original work in the first department we may mention his midwifery forceps with the perineal curve, an important step in the direction of the great principle of axis traction so enthusiastically promulgated by the celebrated Tarnier of Paris. In the department of gynaecology we may mention his shot and coil sutures, his polyptribe and his sigmoid repositer for chronic inversion of the uterus. Dr. Aveling commenced his professional career in Sheffield and from the commencement of that career devoted himself especially to the treatment of the surgical diseases of women. Diligently cultivating this field he soon succeeded in establishing a hospital for women in that town, one of the first of its kind in England. In 1870 he left Sheffield with the good wishes of its citizens, displayed in the form of a public testimonial presented to him by the Mayor in their name. Shortly after settling in London he founded, with the assistance of Dr. Robert Barnes and Dr. Chambers, the Chelsea Hospital for Women. Dr. Aveling was for many years the editor of the *Obstetrical Journal*, during part of which time he was associated with the late Dr. Wiltshire. On his resignation he was succeeded in the editorial chair by Drs. Galabin and Herman successively. His contributions to medical literature were numerous and for the most part exhibited originality to an unusual extent. He was possessed of the inventive faculty, a quality found in other members of his family, for his brother was a well-known engineer who invented the steam road-roller. Dr. Aveling's most important works were "The Influence of Posture on Women in Gynaecic and Obstetric Practice," "The Chamberlens and the Midwifery Forceps," "English Midwives, their History and Prospects," "Memorials of Harvey," and "Inversion of the Uterus." Of the above-mentioned works we can especially recommend to our readers his "History of the Chamberlens and the Midwifery Forceps." In addition to these works Dr. Aveling contributed throughout the whole of his career a series of clinical articles to medical periodicals. He was for some time chairman of the board for examining midwives of the Obstetrical Society of London. He was a believer in the electrical treatment of uterine tumours and employed Apostoll's method of dealing with them. In addition to his professional work he took great interest in archeology. As an example of his work in this direction we may mention "The History of Roche Abbey." Shortly after the publication of this work he was elected a Fellow of the Society of Antiquaries. He also wrote a volume of fables in verse, which he composed during his holidays in Scotland. His remains were cremated at Woking on Thursday, Dec. 15th, in the presence of a large number of friends. He succumbed at the age of sixty-four to an acute attack of typhoid fever, which lasted only ten days.

#### GILBERT W. NORTHEY, M.R.C.S., L.S.A.

MR. NORTHEY, who died on the 16th inst. at the age of forty-two, was one of the best known practitioners in Devonshire. His death took place at Tavistock, his native town, where his father, whom he succeeded in practice, still survives him. Mr. Northey was a very fine type of the country practitioner; a man of indomitable perseverance and of splendid powers of endurance, he has largely fallen a victim to his love of work and his devotion to his patients. Mr. Northey was for the last twenty years in large and active practice in Tavistock and the neighbourhood, and it is not too

much to say that to few men is it given to leave behind them a greater void or to be more generally missed. Alike in the sick room and in the hunting field he had by his genial courtesy made many a Devonshire man with whom he had but the most slender acquaintance feel the charm of his personality. Who deceased leaves behind him a widow and four children and innumerable friends to mourn his early death.

## Medical News.

**UNIVERSITY OF DUBLIN: WINTER COMMENCEMENTS.**—The following degrees were conferred last week by the University Caput:—

*Bachelor in Medicine, Surgery and Obstetrics.*—Arthur Joseph Abbott, Vernon Langley Ardagh, Francis James Barter, George Beare, Henry Mark Eustace, Thomas Gibbons, Robert Wallace Wesley Henry, John Halahan, Gervais Bolton Jones, Frederick Kiddle, Alfred Moore, Hercules Bradshaw Moorhead, Arthur Augustus Mussen, John Switzer Owens, Charles Howard Saunders, Charles Burnett Scott, and Ernest Wentworth Wade.

*Doctor in Medicine.*—Arthur Joseph Abbott, Lyster Cole-Baker, Harry Payle, Frederick James Green, Vernon Lampher Jones, William Ffennell McCarthy, James Acheson McCullagh (stip. cond.), Hercules Bradshaw Moorhead, Nicholas Alexander Reid, Horatio Francis Ninian Scott, Alexander Silcock, Francis Sydney Swiney, and Samuel Constantine Westwood.

*In Absentia.*

*Bachelor in Medicine.*—Henry Lindo Ferguson.  
*Doctor in Medicine.*—James Wilson Eakin, Henry Lindo Ferguson, and Ludovic Tarleton Young (stip. cond.).

**ORDER OF ST. JOHN OF JERUSALEM.**—Her Majesty the Queen has sanctioned the enrolment of Mr. S. Osborn, F.R.C.S., as an honorary associate of the Order of St. John of Jerusalem in recognition of his services in the cause of "first aid to the injured" and he has accordingly received the decoration of the Order.

**INSTRUCTION IN FEVERS.**—It is announced that a course of instruction in the diagnosis and treatment of fevers will be given in January at the five hospitals of the Metropolitan Asylums Board. These courses will be conducted respectively by Dr. Goodall at the Eastern Hospital, Dr. Gayton at the North-Western Hospital, Mr. Bruce at the Western Hospital, Dr. Caiger at the South-Western Hospital and Dr. MacCombie at the South-Eastern Hospital.

**A COTTAGE HOSPITAL FOR REDDITCH.**—Some time ago it was announced that the late Mr. Edwin Smallwood of Alcester had bequeathed the sum of £5000 for the purpose of erecting a cottage hospital for Redditch. Some difference of opinion appears to have arisen with regard to the eligibility of a proposed site, and in the end Mr. W. Smallwood, the brother of the deceased and residuary legatee, has generously supplemented the bequest by the gift of £10,000, the whole sum being sufficient to defray the entire cost of the hospital.

**HOSPITAL SATURDAY FUND.**—On Saturday last a meeting attended for the most part by representatives from metropolitan cycling and athletic clubs was held at the Mansion House with the view of considering the proposal to organise sports in London next year in aid of the medical charities in connexion with the Hospital Saturday Fund. The Lord Mayor took the chair in the first instance and expressed his sympathy with the proposal. Subsequently Mr. Dyke Acland presided, and a resolution was carried pledging the meeting to support the suggestion.

**ÆSCULAPIUS LODGE, No. 2410.**—The ordinary meeting took place at the Café Royal, Regent-street, on the 14th inst. In the unavoidable absence of the W.M., Deputy-Inspector-General Belgrave Ninnis, M.D., R.N., Bro. Brindley James presided, supported by the officers, a large number of brethren and some distinguished visitors. Bros. Hugh Lane, L.R.C.P. Edin., M.R.C.S. Eng. and John Davies, M.R.C.S. Eng., L.S.A. Lond., were unanimously elected joining members. Bros. W. Arbutnot Lane, M.S. Lond., F.R.C.S. Eng., and Frank Fowler, L.R.C.P. Lond., M.R.C.S. Eng., were admitted to the second degree. After the routine business was gone through the lodge was closed. At the subsequent banquet the usual royal and masonic toasts were given with commendable brevity, the intervals being pleasantly occupied by instrumental and vocal music of a high order.

**CHESTER INFIRMARY.**—By charging a shilling a head for viewing Eaton Hall, the seat of the Duke of Westminster, his Grace has been enabled to raise annually some £500, which is handed over to the treasurer of the Chester Infirmary. This year the proceeds from this source have amounted to £600.

**THE EXPOSURE OF PUTRID FISH.**—At the County of London Sessions last week a manufacturer of manure and his carman were charged with collecting fish offal in a putrid state without having subjected it to proper disinfection. The nuisance, it appears, had been continued for a long time, and Sir P. H. Edlin imposed a fine of £40 and bound over both defendants with sureties to keep the peace for twelve months.

**HULL AND EAST RIDING CONVALESCENT HOME.**—For the purpose of raising a fund to provide means for furnishing and maintaining the home, the building for which has been supplied by the generosity of Messrs. J. and F. Reckitt, a public meeting was held this week. It appears that a sum of from £4000 to £5000 will be required for this purpose and an annual income of at least a third of that amount has to be secured. The Mayor, who presided, proposed a resolution thanking Messrs. Reckitt for their generous gift, and in the course of the meeting a hope was expressed that the amount necessary to complete the gift may be forthcoming.

**MEDICAL DEFENCE UNION.**—A council meeting was held at the Medical Institute, Edmund-street, Birmingham, on Friday, Dec. 9th, at 4 P.M., Dr. Saundby in the chair. Eleven fresh applications for membership were accepted. The recommendation of the Metropolitan Local Committee was adopted, and it was resolved to defend a member in an action for malpraxis, with which he was threatened. It was resolved to obtain legal opinion on the interpretation of Section 22 of the Coroners Act 1887. A letter of thanks was received from a member who had been assisted. A local committee was adopted for Monmouthshire, and also for the town of Monmouth. Other business was transacted.

**FOOTBALL CASUALTIES.**—On the 10th inst., while playing a game on the Chilwell-road ground at Beeston, a member of the Chilwell Red Rose Football Club fractured his arm. During a match at Dublin on the 16th inst. between Dublin and Cambridge Universities, a Cambridge "forward" fractured one of his legs. On Saturday last the following casualties occurred:—A youth aged twelve of Small Heath, Birmingham, while playing a game, fractured one of his legs and was admitted to the Queen's Hospital. In the course of a match between Blackpool and Fleetwood reserve teams at the Royal Palace Grounds a Blackpool "forward" fractured one of his legs. In the progress of a match at Coalport between Coalport and Shifnal a player in a scrimmage fractured one of his legs. During a match between the Hartington (Staveley) Club and New Whittington Exchange a player sustained a compound fracture of the right leg and dislocation of the ankle and was removed to the Chesterfield Hospital. In a match at Farnham Park between Farnham and a team from the Lincoln regiment stationed at Aldershot a player fractured his right leg.

**PROSECUTIONS UNDER THE INFECTIOUS DISEASES (NOTIFICATION) ACT.**—The first prosecutions in Liverpool under this Act took place before the stipendiary magistrate on Dec. 14th. It appears from the evidence of Dr. Hope, the deputy medical officer of health, that on Nov. 25th a man named Patten was removed to hospital from 134, Elias-street, suffering from confluent small-pox from which he since died. In accordance with the practice in Liverpool, in addition to the usual disinfection and cleansing of the premises, daily visits were made by the inspector, whose business it was to inquire whether any person in the house is unwell, and if so, to report the matter forthwith. Three of Patten's children developed small-pox on December 2nd and 3rd, and a fourth patient, son of a woman named McKnight who lived in the house, also fell ill with the disease on December 3rd. It was proved that up till December 8th both Mrs. Patten and Mrs. McKnight assured the inspector that every one in the house was perfectly well, and the actual condition of things was not discovered till December 9th. Mrs. Patten was fined the full penalty of 40s. and costs, and Mrs. McKnight 20s. No medical man had been called in.

**JUBILEE OF M. PASTEUR.**—The celebration of the seventieth birthday of M. Pasteur will take place in the Grand Amphitheatre of the New Sorbonne on Tuesday, December 27th, 1892, at 10.30 A.M.

## Appointments.

*Successful applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.*

**BURY, R. F.**, has been appointed House Surgeon to St. George's Hospital.

**CORT, J. G. D.**, L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer of Health for the Second Sanitary District of the Blackburn Union.

**CAMPBELL, W. A.**, M.B., C.M. Glasg., has been appointed Medical Officer for the Usk Sanitary District of the Monmouth Union.

**CRAIGIE, JAMES, M.D.**, C.M., B.Sc. Pub. Health, Edin., has been appointed Medical Officer of Health for the Burgh of Musselburgh, N.B.

**Thursday, December 29.**

**ST. GEORGE'S HOSPITAL.**—Operations, 1 P.M. Surgical Consultations, Wednesday, 1.30 P.M. Ophthalmic Operations, Friday, 1.30 P.M.  
**UNIVERSITY COLLEGE HOSPITAL.**—Operations, 2 P.M. Ear and Throat Department, 9 A.M. Eye Department, 2.

**Friday, December 30.**

**ROYAL SOUTH LONDON OPHTHALMIC HOSPITAL.**—Operations, 2 P.M.  
**UNIVERSITY COLLEGE HOSPITAL.**—Eye Department, 2.

**Saturday, December 31.**

**UNIVERSITY COLLEGE HOSPITAL.**—Operations, 2 P.M.; and Skin Department, 9.15 A.M.

## Notes, Short Comments & Answers to Correspondents.

*It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.*

*Lectures, original articles, and reports should be written on one side only of the paper.*

*Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.*

*We cannot prescribe or recommend practitioners.*

*Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."*

*Letters relating to the publication, sale and advertising departments of THE LANCET to be addressed "To the Publisher."*

*We cannot undertake to return MSS. not used.*

COMMUNICATIONS relating to the EDITORIAL business of THE LANCET must in every case be addressed exclusively "To the Editors," and not to them otherwise than in their official capacity.

### TERCENTENARY OF GALILEO AT PADUA.

A CORRESPONDENT writes:—"I observe in THE LANCET of Dec. 17th that your Special Correspondent refers to the 'admirable English discourses' at the Tercentenary of Galileo at Padua 'losing much of their effect by the strangeness of the language employed.' He must have been misinformed, as not only were the addresses of Sir J. Fayer and Professor Darwin delivered in Italian, but they were received with marks of considerable approval, and the former was printed *verbatim* in the *Veneto* of Dec. 11th."

A *Friendly Society's Medical Officer*.—We cannot reopen the discussion pending the decision of the General Medical Council.

### THE AZORES.

To the Editors of THE LANCET.

SIRS,—When writing recently the account of my visit to the island of St. Michael in the Azores, an abstract of which you printed three weeks ago, I omitted to refer your readers for full information on the subject to the most complete and most interesting account of the nine islands in this Archipelago, written by Mr. W. F. Walker in his work entitled "The Azores or Western Islands," with maps and illustrations (Triibner & Co.). A copy of this work has quite recently been added to the library of the Royal College of Surgeons, Lincoln's-inn, where of course it may be seen by any Fellow or Member.

I am, Sirs, yours truly,

London, Dec. 21st, 1892.

WILLIAM PROWSE.

### PROVISION FOR MEDICAL MEN UNABLE TO WORK.

*Dr. John Craigie*.—The course proposed would be quite impossible. The examining bodies have no powers to impose such a charge. Medical men individually should deny themselves in the early part of life to provide for rainy days and old age. We admit it is difficult to do so; but there are great inducements and facilities, as in the different forms of life insurance. Within the Metropolitan Postal District the Society for the Widows and Orphans of Medical Men dying with scanty residue is an admirable society with ample funds, only complaining of being inadequately appreciated by those whose families might benefit by its steadily increasing accumulations.

### MEDICAL ATTENDANCE ON SOLDIERS AND SAILORS.

WITH reference to the inquiry of "Perplexed" in our last issue (p. 1425), he will be interested to know that a claim for medicines and attendance on a soldier can be recovered from the State under the conditions which are laid down in the Army and Navy Regulations, paragraphs 50 and 828. He should write to the principal medical officer of the district for Army Form O1600, and make out his claim upon this document.

### "L'AMENDE HONORABLE."

THE following apology has been sent to Mr. Victor Horsley:—

"Dec. 17th, 1892.

"SIR,—This morning's post has brought me a letter from the secretary of the Victoria-street Society, of which I herewith enclose a copy. From that letter it appears that I was entirely misled in making, on the authority of the writer's former assurance, the statement in our extra number published last month with regard to the alleged falseness of your charge against the Duke of Newcastle. So far, therefore, as concerns the assertion in that article that your statement was untrue, I hasten to offer you the fullest retraction and the most sincere apology. A similar apology will of course be made in the January number of the *Review*, the issue of which I have desired the printers to hasten as much as possible, that no time may be lost in withdrawing, as publicly as it was made, the misstatement we were unfortunately deceived into adopting. Should you desire to send copies of the number containing the retraction to any of your friends I shall be happy to place them at your disposal.—I am &c.,

"(Signed)

"THE EDITOR OF THE 'VERULAN REVIEW.'"

Enclosure.

"Victoria-street Society, Dec. 15th, 1892.

"SIR,—I am directed to inform you that on further inquiry it has been found that the Duke of Newcastle did consult Professor Horsley while a Vice-President of this Society. His name has therefore been removed from the list.—I am &c.,

"(Signed)

B. BRYAN, per S.B."

C. T. R.—In the cases mentioned by our correspondent effectual disinfection can only be insured by the use of such powerful agents as sulphur dioxide, chlorine or bromine. There are very simple contrivances to be had for the vapourisation of carbolic acid, eucalyptus &c., which may be obtained at any of the well-known wholesale houses.

*Scatpel*.—We think it would be held that the covenant was infringed.

### "WATCHMAKERS AS OCULISTS."—AN EXPLANATION.

To the Editors of THE LANCET.

SIRS,—Our attention has been called to a paragraph that appeared in THE LANCET of last week under the above heading. We beg herewith to give you our explanation of the original paragraph in the *Hydrological Journal*. Our ideas were to furnish London and country jewellers &c. with the required information for correct execution of oculists' prescriptions, with which we find from a large experience they are brought in daily touch, and to enable them to take correct measurements for fitting spectacles and folders, also to point out the relative value of the focal measurement of lenses—several systems of which are in use, and lead often to errors and lengthy correspondence. Moreover, we proposed to make clear the system of neutralisation of lenses and the properties of prisms, cylinder and spherical lenses; all of which we considered could be better explained by a qualified and experienced medical man, hence our sole reason for proposing to retain the services of Dr. W. Percy Jones. At the same time we regret to note that through an error Dr. Jones was described as of the Westminster Ophthalmic Hospital.

We are, Sirs, yours truly,

Oxford-street, W., Dec. 21st, 1892.

J. RAPHAEL & CO.

### TAKING THE OATH.

A CORRESPONDENT writes:—"In confirmation of your article on 'Oath Administration' may I venture to relate the following circumstance which happened to my father, Dr. L—, many years ago. He was one of the Middlesex magistrates when a witness—a Scotchman—came before him to give evidence. Something in the man's manner led my father to think that he was about to swear falsely. When the clerk had handed the book and the witness was proceeding quite readily to take the English oath my father stopped him and, lifting up his hand, began very slowly with the words—'I swear by Almighty God' &c. The man drew back, saying, 'Na, na, I canna tak that oath.' Does not this point to the greater solemnity of the oath by the 'uplifted hand'?"

A. B. C.—We do not recommend practitioners.

### THE MORALITY OF VIVISECTION.

W. J. C. writes:—"Might not vivisection find a precedent in the 'scapegoat' for their practices? The Sacred Narrative (Leviticus, xvi) states that the Deity instructed His priest to inflict a lingering, and probably a painful, death on an inoffensive animal, to save a people from the effects of their sins."

## DOUBLE QUINSY.

Mr. J. A. Eytton-Jones sends us notes of an interesting case of double quinsy, followed by laryngitis, pneumonia and death, notwithstanding some improvement consequent on tracheotomy. The patient, a healthy male, ten months old, the child of healthy parents, developed a double quinsy, with enlargement of the sub-maxillary glands. About the fifth day of illness there was some inspiratory dyspnoea, and some hours later tracheotomy became necessary and was successfully performed. There is said to have been no evidence of false membrane in the fauces or trachea, but in the absence of a post-mortem examination we do not think one can speak with positiveness in this matter. The report makes no mention of the presence or absence of albuminuria, but refers to an imperfectly ventilated drain in the vicinity of the patient. The clinical sequence of events in the absence of positive proof to the contrary is suggestive of diphtheria, a scourge which may be marked in its onset, may occur in circumstances of apparently good sanitation, and whose true nature is sometimes first declared by the presence of albuminuria.

Dr. Thomas W. Parkinson (Tongue).—Our correspondent will find a very perfect description of "retro-pharyngeal abscess," with a complete bibliography of the subject in Bosworth's new volume on "Diseases of the Throat," published by Wood, New York.

## "VESALIUS THE ANATOMIST."

To the Editors of THE LANCET.

SIRS,—I would recommend to your correspondent "G. M. C." the "Histoire de l'Anatomie et de la Chirurgie" of M. Portal, published in Paris by P. Fr. Didot le jeune, Quai du Augustins, 1770, where, in the first volume, commencing at page 394 and ending at 433, he will find the fullest account of Vesalius's life and work with which I am acquainted. Albert von Haller, who so much admired the writings of Vesalius, has, in his "Bibliotheca Anatomica," vol. i., liber iv., § 103, pp. 180-87 inclusive, given a good summary of the anatomist's life. Boerhaave and his pupil Albinus wrote a biographical sketch of Vesalius. Haller and Portal both tell of the hatred felt to Vesalius by his contemporaries, especially his quondam friends J. Gunther and Jacobus Bois, with whom as a student he learned the anatomy of Galen. That he died a bachelor is, I think, pretty certain. No writer that I know of makes mention of his having been married; and after his death the vindication of his character was undertaken by his brother, Francis Vesalius, who gave up the study of law and embraced that of medicine, that he might defeat the calumnies of his brother's enemies. On the disputed question, Did Titian illustrate a copy of Vesalius's works? I can give an affirmative answer, and I am not without hope of becoming the possessor of a copy. I may just add that Knight, who published about 1835, considers that it was some political trouble that caused Vesalius to undertake his memorable journey to Jerusalem. Nevertheless, the more I read on the subject the more convinced I am that the flight was to escape clerical persecution. I am, Sirs, yours truly,

Dublin, Dec. 17th, 1892.

GEORGE FOX, F.R.C.S.I.

To the Editors of THE LANCET.

SIRS,—I have much pleasure in giving "G. M. C." the required information. Andreas Vesalius was born at Wesel on the Rhine. Therefore, according to the custom of the time, he adopted the name of Vesalius. Three weasels (Old German "Wesel") are represented on his family escutcheon. He studied at Louvain; was a resurrectionist, according to his own confession; went to Paris, where he worked under Sylvius, and, when only twenty-two years old, his fame was so great that he was appointed professor of anatomy at Padua. According to Lauth ("Histoire de l'Anatomie"), he contracted an unfortunate marriage with a wicked woman. He had a severe illness, during which he made a vow that if he recovered he would undertake a pilgrimage to Jerusalem. Persecuted by the Catholics of Madrid, he carried this resolve into effect. Coming back he suffered shipwreck at the Island of Zante. Here he contracted a severe illness, which proved fatal, and he died, deserted by everybody, at the early age of fifty. Prof. Burggraeve's work ("Études sur André Vesal," Gand, 1841) gives a complete life-history of the great man. I am, Sirs, yours truly,

Harlesden, N.W., Dec. 10th, 1892.

JULIUS MOSTERTZ.

To the Editors of THE LANCET.

SIRS,—Your correspondent "G. M. C." asks, at page 1424 of your last issue, for information regarding the life and history of Vesalius. In the *Asclepiad*, 1885, p. 132, he will find this subject fully treated. In THE LANCET, Juno, 1889, p. 1041, he will find an interesting annotation as to whether Vesalius dissected the living. These references are to be seen in Section 565:6 of the "Medical Digest."

I am, Sirs, obediently yours,

Boundary-rd., N.W., Dec. 10th, 1892. RICHD. NEALE, M.D. Lond.

## GASTROTOMY FOR FOREIGN BODY.

A WOMAN, aged sixty-nine, in a distressed condition of mind, supposed to have swallowed a full-sized razor on Tuesday, Dec. 13th, was admitted into the Lincoln County Hospital the same day. There were no symptoms, and the presence of the razor could not be determined until Sunday, Dec. 18th, when the end could be felt in the region of the pylorus. On Monday vomiting commenced, and Mr. Cant, one of the surgeons to the hospital, operated. Opening the abdomen by an incision in the median line, then seizing the razor and bringing the stomach to the opening, he was able successfully to remove it. The wound in the stomach was doubly sutured and the external wound closed. Thirty hours after the operation the temperature was normal; the bowels had acted naturally and there was no unfavourable symptom. The razor, a large, black, bone-handled one, was somewhat acted upon by its six days' digestion.

## DIARIES &amp;C.

We have already received several new medical diaries for the approaching year and these have been brought under the notice of our readers. Specimen pages of Smith's "Physicians, Surgeons' and General Practitioners' Visiting List, Diary, Almanack and Book of Engagements" have been submitted to us, as well as a copy of the book. The specimen pages are circulated for the guidance of those who have not as yet used the book. The almanack is of a convenient size for the pocket and contains ample information for medical officers of health and for general practitioners. Postal regulations, tables of wages, a pharmacopoeial companion and other information of a trustworthy kind is given. Ruled pages are provided for visiting list and journal, obstetric engagements, addresses, lists of instruments lent and wanted &c. Altogether the book is as perfect and complete as it is possible for a medical man's diary to be.

## THE "DRIQUIC" BLOTTING PAD.

MESSRS. SPICER BROTHERS, 2, New Bridge-street, E.C., have submitted to us a specimen of their new Blotting Pad, furnished with a material which they have named "Driquic." We have examined and tested with some care this fresh addition to the armamentaria of the writing desk and find it for the purpose intended to be much superior to the pads ordinarily employed. A disadvantage commonly experienced by persons who have occasion to make constant use of a pad is that the absorbent power of the blotting paper speedily becomes exhausted, thus necessitating the provision of a fresh sheet. This inconvenience is very much modified by the use of the "Driquic" pad.

## "A MODE OF PRESERVING LYMPH."

In the letter of Dr. James Tily which we published in our issue of Dec. 3rd it appears that an error arose in the interpretation of the meaning of the prescription which he recommended for the preservation of vaccine lymph. The following was the actual wording of the formula: "℞. Vaccine lymph, ℥v; best glycerine, aq. destillat, aa par. œq., ℥v." This was rendered: "Vaccine lymph 5 minims, best glycerine and distilled water of each 5 minims." By this Dr. Tily was inadvertently made to appear as if he wished the lymph to be diluted to twice the extent which he actually intended.

ERRATUM.—On page 1398 of our issue of Dec. 17th the last line of the first paragraph should read "Autobiography of a Slander," by Edna Lyall.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

During the week marked copies of the following newspapers have been received:—*North Wales Observer, South Austell Weekly News, Millom Gazette, Public Opinion, Sheffield and Rotherham Independent, Cork Constitution, National Reformer, Retford News, Bucks Herald, Aberdeen Times, Alnwick County Gazette, Birmingham Daily Post, Pudsey News, Surrey Comet, Louth Times, Worthing Gazette, Leicester Daily Post, English Mechanic, Manchester Examiner, Manchester Courier, Birmingham Daily Gazette, The Telegram (Dorset), Echo, South and North Lincolnshire Advertiser, Sanitary Record, Mining Journal, Local Government Chronicle, Insurance Record, Bristol Mercury, Hertfordshire Mercury, Weekly Free Press and Aberdeen Herald, Reading Mercury, Liverpool Daily Post, Leeds Mercury, Yorkshire Post, Surrey Advertiser, West Middlesex Advertiser, Pioneer Mail, Local Government Journal, Guy's Hospital Gazette, West Middlesex Standard, Times of India, Coatbridge Express, Norwich Mercury, Citizen, Hereford Times, Le Temps (Paris), Sunday Times, Builder, Architect, City Press.*

Communications, Letters &c. have been received from—

A.—Mr. F. S. Allen, Madefra; Messrs. Anderson and Co., Edinburgh; Messrs. Armour and Co., London; Messrs. Austin and Son, Clifton; Anglo-Swiss Condensed Milk Co., London.

NOTICE.—Advertisers are requested to observe that it is contrary to the Postal Regulations to receive at Post Offices letters addressed to initials only.

An original and novel feature of "THE LANCET General Advertiser" is a special Index to Advertisements on pages 2 and 4, which not only affords a ready means of finding any notice, but is in itself an additional advertisement.

Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance.

Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET.

Terms for Serial Insertions may be obtained of the Publisher, to whom all letters relating to Advertisements or Subscriptions should be addressed.

THE LANCET can be obtained at all Messrs. W. H. Smith and Son's Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Agent for the Advertisement Department in France—J. ASTIER, 66, Rue Caumartin, Paris.

ABSTRACT OF A  
Clinical Lecture

ON  
INFLAMMATION STARTING IN THAT PORTION OF THE ALIMENTARY CANAL SITUATED IN THE RIGHT ILIAC FOSSA.

*Delivered at the General Hospital, Birmingham, on Nov. 10th, 1892,*

By WILLIAM F. HASLAM, F.R.C.S.ENG.,  
SURGEON TO THE HOSPITAL.

GENTLEMEN,—In approaching the question of affections of that portion of the alimentary canal situated in the right iliac fossa, characterised by inflammation, with or without the formation of pus, it will be well to note the clinical characters of cases as they come before us with symptoms either directly referring to that region or where, by operation or after death, the initial lesion of an extensive suppuration or general peritonitis is found to have been situated there. 1. Patients, often young adult males, are from time to time seen with these symptoms: Constipation, nausea or vomiting, slight elevation of temperature—not, however, associated with any rigor—pain in the right iliac fossa of varying intensity, though not as a rule severe, tenderness in this region, together with some swelling that appears early and is comparatively large and at times doughy. Under simple treatment, combined with rest, the attack passes off and recovery takes place, though there may be subsequent recurrent attacks. In these cases there is often a previous history of constipation. 2. When symptoms somewhat similar to the above but more severe are met with. There is often an initial chill or rigor, the temperature rises to a higher level, there is general tenderness of the abdomen, so that unless a careful examination is made no special tenderness is noticed in the right iliac fossa. This, however, can be detected in the early stage of the disease by pressing with the fingertip on a point one and a half to two inches from the anterior superior iliac spine on a line from that point to the umbilicus. This corresponds closely to the root of the vermiform appendix and is known as McBurney's point. There is a tendency for pain, which in the abdomen is often considerable, to radiate to the testis, thigh, and perineum. The right abdominal muscles may be rigid. Swelling appears after a few days, but not so early as in the preceding class of cases and is more fixed; it can at times be made out from the rectum. Cases presenting these symptoms may terminate either (a) by complete recovery, or by a partial recovery which is followed by relapses, the severity of which often increases with their number and any one may set up serious or even fatal mischief; (b) by an increase of all the symptoms and by suppuration occurring, either limited by adhesions to its own particular neighbourhood, and after a time making its way to the surface, or by bursting through the adhesions and invading the general peritoneal cavity, giving rise to a sudden development of the signs of a general and acute peritonitis; or (c) by the production of the same condition owing to a suppurating or gangrenous appendix discharging its contents into a peritoneum unprotected by limiting adhesions. 3. A few cases are met with in which the patient, often a young boy, is attacked by the sudden onset of a most violent and acute peritonitis, but in whom there is nothing in the antecedent history pointing to the right iliac fossa as the starting point of it, yet a post-mortem examination shows death to have been caused by a purulent peritonitis due to rupture of an appendix containing fetid pus and often in a condition of gangrene. Here then are several groups of cases having (with the exception of the last) certain symptoms in common, such as fever, with pain and swelling in the right iliac fossa, yet some get well never to recur, others never completely recover but relapse again and again, while others terminate in abscess that may point at the surface or burst into the general peritoneal cavity. What are the pathological conditions met with in these cases and what means have we for

coming to any conclusion as to the actual state of affairs in each case so that we may treat it on sound principles? Until the last few years these conditions were spoken of either as perityphlitis or typhlitis, but recently the term "appendicitis" has been applied to at any rate a large number of them, as it has been abundantly proved, both by operation and by post-mortem examination, that the appendix has been the cause of the disease. Perityphlitis was first used at a time when it was supposed that the cellular tissue in the iliac fossa became inflamed as a primary affection independently of any inflammation of the cæcum or appendix. If such occurred there could be no objection to the name, but inasmuch as this is not the case it seems advisable to use the term typhlitis where there seems to be good reason to regard the cæcum as the seat of the disease and to signify that the appendix is at fault by using the term appendicitis. Perityphlitis has also been used by those who, while recognising the importance of the appendix as a potent factor in the causation of mischief here, preferred it as indicating that the swelling is around the cæcum. The use, however, of these terms, if founded on an accurate diagnosis of the case, is of more than passing interest, for in studying the pathology of these affections in the iliac fossa we find that the contents of the region—viz., the cæcum and appendix—give rise to symptoms that differ in degree and course. Speaking broadly, while the cæcum is responsible for a few cases where there has been only one attack, probably of a mild character, and many of those in which recurrence has taken place, the appendix is the cause of relapsing ones and nearly all those in which suppuration occurs, suppuration and perforation being seldom due to the cæcum. The numerous cases that have now been recorded enable us to formulate some facts as to the pathology of the cæcum and appendix, while from recent research of Treves and others into the anatomy of these parts certain points have been made out that throw further light on the subject. For instance, it has been shown that the cæcum is usually entirely covered by peritoneum, and that though it may not have a mesentery, as the appendix has, it is for practical purposes as much within the peritoneal cavity as that is; consequently inflammation spreading from its interior is likely to reach a peritoneal covering and not any cellular tissue in the iliac fossa. The mucous membrane of the cæcum may be inflamed in association with a general colitis, or more frequently from irritation due to retention and impaction of feces; inflammation thus started may spread into the appendix, and by closing the opening from this into the cæcum give rise to an appendicitis with retention of mucus, a recognised cause of recurrent attacks. The cæcum may be the seat of ulceration, either from fecal irritation, tubercle, dysentery, typhoid or foreign body, this latter being extremely rare. As the result of ulceration its peritoneal coat may become inflamed, together with the peritoneum in the immediate neighbourhood, producing matting together of parts and in very rare cases suppuration or even perforation. From a pathological point of view, then, the cæcum offers a ready explanation for mild and for many recurrent attacks, the cause being usually fecal accumulation; but for the cause of those in which suppuration is met with we must, with but few exceptions, look elsewhere. If now we inquire what has been found in the appendix when it has been removed for relapsing attacks, or seen at the bottom of an abscess that has been opened, or in the post-mortem room, we find conditions that will account for some recurrent attacks, and for nearly all those where there have been relapses—the patient never having been completely well between the attacks—or where suppuration or perforation had taken place.

Dr. Robert W. Weir of New York has published records of twenty-six cases where removal of the appendix was effected between the attacks, and from these we learn that in no case was any foreign body found; foreign bodies usually causing the graver lesion of perforation. In ten of these cases a catarrhal appendicitis was found, the lumen of the tube being greatly reduced in size; in others, in addition to the catarrh, the tube was found to be distended with mucus or muco-pus. In four there was either bending or kinking of the appendix on itself or a stenosis at its upper end with an accumulation of its contents. While these conditions are sufficient to account for symptoms it must be remembered that post-mortem records show that evidences of previous inflammation of the appendix are often found in those who have died from other causes and who never had symptoms pointing to this region. In the suppurative or perforated cases the appendix has been

found twisted and gangrenous, perforated, with or without there being any foreign body or, what is practically the same thing, any hard fecal concretion. Another curious fact that has been demonstrated by early operation and its results by examination after death in some cases of acute peritonitis, is that the appendix may be distended with fluid and pass into a condition of gangrene without there being any limiting adhesions. There may be then in the cæcum and appendix causes which can produce peritonitis of varying degrees of intensity. When the peritoneum over the cæcum becomes inflamed, as the result probably of a stercoral ulcer, it may with the relief of the cause of this resolve, or if of greater severity various adhesions and matting together of parts may result, or in very rare cases suppuration or even perforation may take place; but with the appendix the risks of serious trouble are far greater. In favourable cases no doubt resolution with but slight inflammation may take place, in others a dense mass of inflammatory tissue may form, matting together the structures in the neighbourhood; this may remain more or less quiescent, or there may be in its centre a small quantity of pus ready at any time to light up further mischief; or a slight leakage may take place from a distended appendix, but the escaping fluid is prevented either by old adhesions or by a protective inflammation of the peritoneum on neighbouring parts from invading more than a limited part of the peritoneum; this leakage will then set up an abscess, which may make its way to the surface, break into an adjacent organ or into the general peritoneal cavity. And lastly, a distended appendix may discharge its contents directly into the general peritoneal cavity, owing to the absence of proper adhesions. The fact that an abscess, at first localised, may invade this cavity by a bursting of its wall must be ever before one: for, firstly, it is desirable to prevent this—an almost certainly fatal complication—by the early evacuation of pus; and, secondly, when opening one of these limited abscesses the greatest care should be taken to avoid, by rough handling or syringing out, breaking through a barrier whose thickness is unknown but on whose integrity the patient's life may depend. The line of treatment to be adopted in these conditions has provided ample opportunity for the expression of somewhat conflicting opinions by physicians and surgeons. Nor is this to be wondered at when the position is viewed from a distance. Not so many years ago these cases, as already pointed out, were termed cases of perityphlitis or typhlitis, and though the appendix was seen at times to be the cause of the mischief, it was not assigned its proper place, as a frequent cause, until more recently. Cases, then, with symptoms referable to this region, when admitted into the wards of a general hospital, would naturally be assigned to the medical or surgical side, according to the prominent symptoms of each. Those, for instance, where the symptoms were slight—that is, pain in the right iliac fossa, resistance or even swelling, with some elevation of temperature—would naturally come under the care of the physician, who by simple measures would conduct the case to a successful termination. While at the other extreme, cases with local suppuration or general acute peritonitis would come to the surgeon, who would find an operation urgently needed. Consequently while physicians were in favour of general treatment, surgeons on the other hand favoured operation. These conflicting opinions therefore were based on the fact that the physician saw most of the cases where the cæcum was at fault and some where the recurrent attacks were due to the appendix, while the surgeon met with those in which the appendix was the cause of suppuration or perforation and where obviously nothing short of operative interference would be of any avail. These two conditions were not however clearly defined pathologically, but were spoken of under one name, so that one side, finding the so-called cases of typhlitis do well without operation, supported treatment by simple measures, while the other side, finding that cases known by the same name required operation, advocated that as the proper treatment—the fact being that two varieties of disease were grouped under one name, and consequently it was impossible to apply a general rule of treatment to both. It is only by a division pathologically into those where the disease is due to the cæcum, or typhlitis, and those where it is due to the appendix, or appendicitis, that we can see on what lines to proceed. If clinically the case can be diagnosed as typhlitis, then there is no doubt that operative interference is seldom called for; but if, on the other hand, appendicitis is a correct diagnosis, the question of operative interference may present itself under two circumstances: firstly, for the evacuation of pus from a local abscess or

from the general peritoneal cavity; and secondly, for the relief of relapsing attacks. As the formation of a correct diagnosis between typhlitis and appendicitis is a matter of considerable practical moment, what are the signs on which such a distinction can be based? It is always a difficult matter to draw clear and early distinctions between two diseases which have up to a certain stage a considerable resemblance to each other; but when, as in the conditions under consideration, we remember that the cæcum and appendix are situated in the same region and that a certain amount of localised peritonitis is common as an early symptom when inflammation spreads from the interior of either, the difficulty of accurately determining the starting point of the disease is considerably increased. It is only by knowing certain points on which careful inquiry should be made and by a judicious weighing of the evidence derived from an examination of the patient that we can come to any conclusion. The points for careful inquiry are as follows: 1. The onset of the disease. In typhlitis this is less sudden and less marked than, at any rate, in many cases of appendicitis. 2. Pain in typhlitis is less severe and more confined to the region of the cæcum; it is not so diffused over the abdomen nor does it tend to radiate to distant parts. 3. Tenderness in typhlitis is more local, but there is not any one spot where *excessive* tenderness can be elicited by digital pressure, as can be done in the early stages of appendicitis at McBurney's spot. 4. The swelling in typhlitis appears early; it is larger, less fixed, more doughy and more easily felt than in appendicitis. It cannot be felt from the rectum. 5. The febrile disturbance as indicated by the temperature and pulse is less in typhlitis than in appendicitis. 6. The progress of the case. In typhlitis many cases soon tend to get well. In appendicitis, while undoubtedly some recover under general treatment, many others steadily increase in severity until pus is formed, while others relapse. 7. A previous history of many attacks would rather favour a diagnosis of typhlitis, especially if a reliable history could be obtained of these being accompanied by swelling in the right iliac fossa. Recurrent attacks of appendicitis may occur without there being any evidence of tumour, and there is moreover a tendency in many cases for these attacks to terminate in suppuration or perforation. Dr. Weir records the examination of thirty cases of acute perforative appendicitis following recurrent attacks and the explosion into abscess or general peritonitis occurred in twenty-two before the third attack and only once after the fifth. 8. A previous history of constipation is suggestive of typhlitis. But it must be remembered that owing to the varying degree of the severity of these attacks there is in many cases considerable difficulty in coming to a satisfactory diagnosis.

Looking at the records of cases, it seems that if the symptoms are due to the appendix surgical interference is called for (1) in all cases where the general peritoneal cavity is involved; (2) where there is evidence of local abscess; (3) where in the course of an acute attack symptoms progress in spite of treatment and where there are good grounds to believe that pus is being formed, though it is too deeply situated to give rise to fluctuation. These cases form perhaps the most important group, as by the early opening of a deep-seated and as yet small abscess a general peritonitis may be avoided. It may be asked whether deep-seated pus can be detected by the aspirating needle. No one would deny that at times it may, but on all considerations it is better not to use the aspirating needle; far more useful information is obtained by an exploratory incision. Puncture by a needle here is by no means free from danger, nor is the information it gives at all reliable, unless of course pus is drawn. (4) In those relapsing cases where the restoration to health is incomplete and the patient is rendered unfit for the duties of life. In these cases there seems to be good reason to believe that the patient's safety is best consulted by an exploration and possible removal of the appendix in an interval between the attacks.

**FOOTBALL CASUALTY.**—A youth aged nineteen, while playing a game last week at St. Mary's-row, Birmingham, sustained a dislocated ankle.

**MEDICAL MAGISTRATES.**—Mr. Robert Parry, L.R.C.P. Lond., M.R.C.S., of Carnarvon, and Mr. Anthony Herbert Martin, M.R.C.S., L.S.A., of Evesham, have been placed on the Commission of the Peace for the Borough of Carnarvon and County of Worcester respectively.

## MYOSITIS OSSIFICANS.

BY CHARLES STONHAM, F.R.C.S. ENG.,  
ASSISTANT SURGEON TO THE WESTMINSTER HOSPITAL.

IN the following paper I propose to consider the present position of our knowledge of the fortunately rare disease known as myositis ossificans. Comparatively few cases have been so far recorded, but those which have been observed have presented a chain of symptoms of great interest and have excited so much speculation as to their causation that the bibliography of the subject, a list of which is appended, is already extensive. The principal contributions of English writers to our knowledge of myositis ossificans are a paper by London, read before the First Intercolonial Medical Congress, Adelaide, 1887, and one by the late Mr. Sympton. The latter gentleman some time before his death kindly sent me further details of his case, with permission to use them for embodiment in this paper. Mr. Willett has also kindly placed at my disposal the notes of a case under his observation at St. Bartholomew's Hospital.

*Further Progress of Mr. Sympton's Case, Brit. Med. Jour., vol. ii. 1886, p. 1026.*

Jan. 24th, 1887.—Two bosses the size of filberts are now present to the inner side of that situated over the posterior superior spine of the right ilium. The boy is in good health and has gained flesh. The parents have now removed to a village six miles from Lincoln.—Aug. 7th: The boy has fallen over a bucket and fractured both bones of his left forearm at the junction of the lower with the middle third. The parents have returned to Lincoln.—Aug. 24th: A hard boss the size of a cobnut has formed at the insertion of each pectoralis major and the anterior margin of each splenius is tense and indurated. The boy suffers no pain and his general health is excellent.—January 17th, 1891: The fracture united well. Three weeks ago the boy complained of pain and stiffness of the right side of his neck and of a swelling below the right ear. The pain has now left him, but there is a boss the size of a walnut in the upper third of the right sterno-mastoid muscle. There are also six nodules the size of buck shot in the latissimus dorsi between the left scapula and the spine. He continues in good health.

*Additional Note kindly sent me by Mr. E. Mansel Sympton.*

Nov. 12th, 1892.—Eight months ago C. A. M.—fell on his right patella and soon afterwards a hard swelling appeared on its surface. This is now of the shape of a limpet shell. For the last four months he has complained of stiffness and swelling above the left knee. Now there is a firm hard lump involving the rectus, vastus externus and internus, and extending from just above the patella upwards for about four inches. On the left side also there is a similar swelling just above the popliteal space in the biceps and semi-tendinosus muscles. Thus the movement at the knee-joint is considerably limited. A nodule about the size of a filbert can also be felt about half-way up the inner side of the thigh, apparently situated in the sartorius muscle. The seat of fracture of the bones of the left forearm is still marked by a nodule, though the bones are quite straight. The lad keeps in good health, but he feels pain in the various swellings and in the places where the swellings have occurred in cold and damp weather.

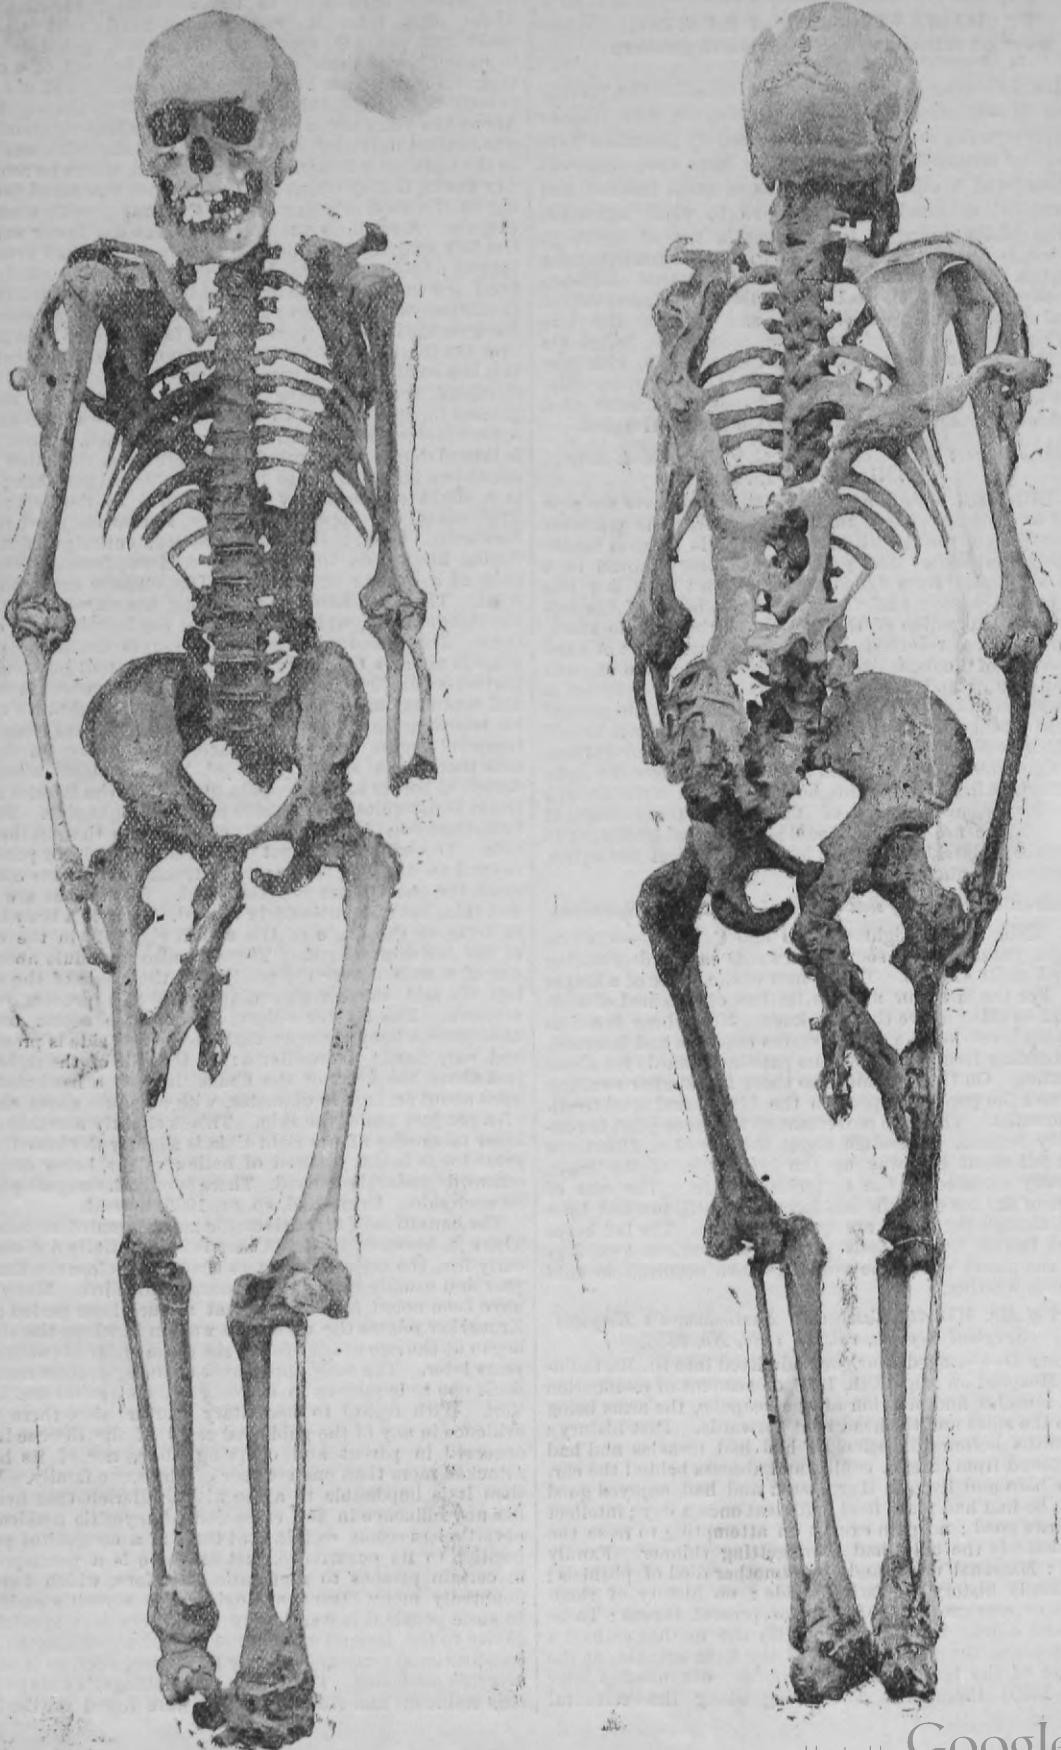

*Report of Mr. Willett's Case in St. Bartholomew's Hospital Surgical Reports, vol. iii. 1886, No. 2556.*

Thomas D—, aged four, was admitted into St. Bartholomew's Hospital on Aug. 30th, 1886, on account of ossification of the muscles and fixation of the scapulae, the arms being kept to the sides and the head bent forwards. Past history: Six months before admission he had had measles and had also suffered from eczema capitis and abscess behind the ear. He was born and lived in Haggerston and had enjoyed good health; he had had plain food and meat once a day; intellect and spirits good; no pain except on attempting to raise the arms; latterly the child had been getting thinner. Family history: Maternal uncle and grandmother died of phthisis; good family history on father's side; no history of rheumatism or new growths. History of present illness: Three years and a half ago (January, 1883) the mother noticed a swelling about the superior angle of the right scapula, at the insertion of the levator anguli scapulae. Six months later (July, 1883) there was a swelling along the vertebral

border of the bone and about the inferior angle, which the mother attributed to the shoulder "growing out." About this time it was also noticed that the boy could not put his spoon to his mouth, not being able to raise his right arm sufficiently. He fell out of a child's high chair and hurt himself, but the mother did not know exactly where; after this he kept his head to the right side. About two years and a half ago (January 1884) a prominence was noticed in the left erector spinae and the child was taken to the Children's Hospital, Hackney-road, where he remained five weeks, during which time no increase was noted (according to the mother's account) in the bony growth about the scapula. A swelling was now noticed at the lower angle of the left scapula and the movements of the left arm were limited; before this the left arm was the one used. The head now began to come over and lean towards the left side. Condition on admission: Right frontal eminence enlarged. Neck on the left side: there is slight fulness and a hard growth over the fourth and fifth cervical transverse processes; over this is a small movable tumour like a bursa. There is caput obstupum, the head being inclined to the left, the mastoid process brought nearer to the clavicle. The sterno-mastoid muscle is stretched over the swelling mentioned. Spine: There is lateral dorsal curvature to the right, the deviation being about two inches opposite the eighth dorsal vertebra; there is a slight compensatory lumbar curve to the left; some kyphosis of the upper dorsal spine, so that the head is bent forwards. Chest: Respiration almost entirely abdominal; during inspiration there is only a circumferential thoracic gain of a quarter of an inch. The scapulae are both quite fixed. There is a hard growth along the vertebral border of the right scapula, which is largest at the inferior angle of the bone. The latissimus dorsi as it covers the angle of the scapula appears to be changed into bone, and the tendinous portion extending from this point to the humerus is ossified and contains hard irregular nodules. The right arm cannot be raised quite to the horizontal; the fingers touch the temporal region and easily reach the mouth. On the left side there is a similar mass of bony hardness along the vertebral border of the scapula and above the inferior angle, but it is not quite so extensive as on the right side. The left latissimus dorsi is in a similar condition to that on the right side. The left arm cannot be raised, actively or passively, beyond an angle of 45° from the trunk; the fingers can just reach the mouth, but not the head. Both arms are small and thin, but not particularly wasted. There is a bony nodule in front of the angle of the eighth right rib in the course of the latissimus dorsi. There is also a nodule about the size of a walnut over the position of the angle of the eighth left rib and the corresponding transverse process of the vertebra. The erector spinae on each side seems to have undergone a bony change; that on the left side is prominent and very hard. Lower limbs: On the side of the right knee just above the head of the fibula there is a hard plate-like mass about an inch in diameter, with a nodule about the size of a pea just under the skin. This is slightly movable. The inner tuberosity of the right tibia is slightly thickened. Each great toe is in the position of hallux valgus, being displaced outwards under the second. There is only the unguis phalanx on each side. Urine acid, sp. gr. 1025, normal.

The causation of myositis ossificans is shrouded in obscurity. There is, however, no doubt that it is essentially a disease of early life, the majority of cases occurring before the fifteenth year and usually between the second and third. Many cases have been noted as beginning at a much later period; thus Kronecker relates the case of a woman in whom the disease began at the age of fifty-four: she came under his notice two years later. The early appearance of the symptoms naturally leads one to inquire as to heredity and congenital predisposition. With regard to hereditary transmission there is no evidence in any of the published cases of the disease having occurred in parent and offspring alike, nor of its having attacked more than one member of the same family. While then it is impossible to agree with Helferich that heredity has any influence in the causation of myositis ossificans, it nevertheless seems certain that there is a congenital predisposition to its occurrence, just as there is a predisposition in certain persons to rheumatic affections, which have undoubtedly many strong analogies with myositis ossificans. In some people it is well known that there is a special proclivity to the formation of bony growths, pointing to some constitutional tendency to bony formation, such as is seen in myositis ossificans. In Billroth and Zollinger's case of myositis ossificans numerous osteomata were found on the bones

FIG. 1.

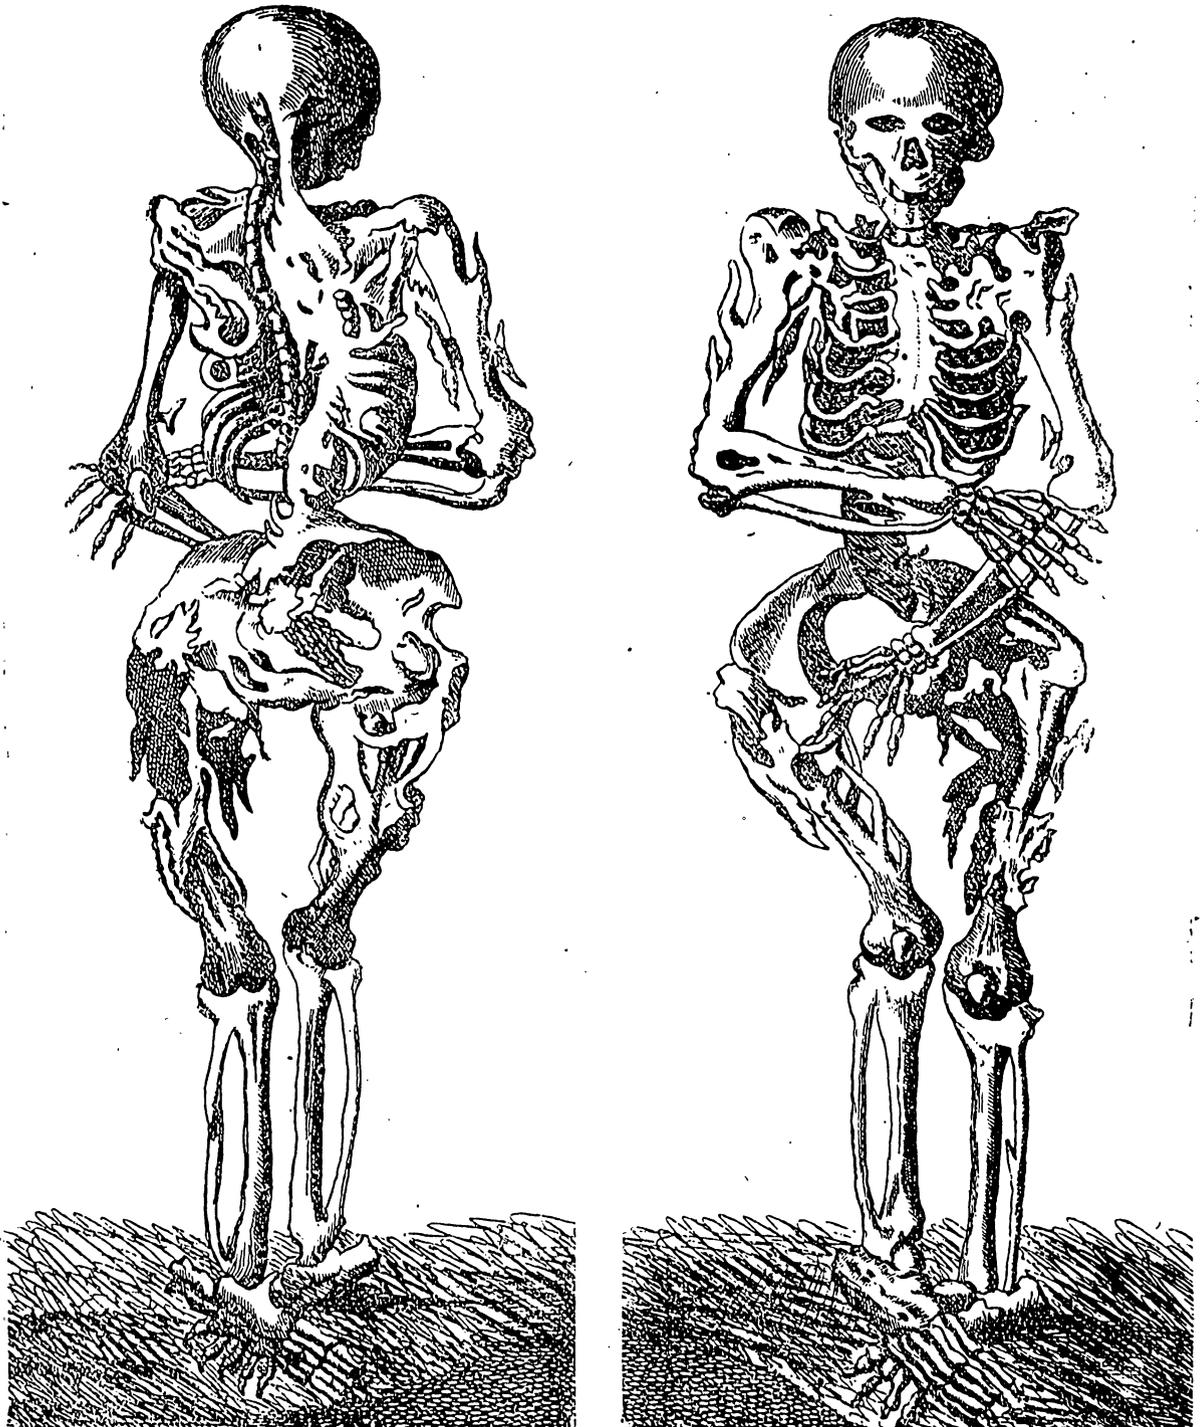

From the specimen in the Museum of the Royal College of Surgeons, England.

and it is specially noted that these were true osteomata and not ossific deposits at the tendinous insertions. Skinner, Eberth, Minkowitsch and others have noted similar cases. Admitting, however—and it seems impossible to doubt it—a

point in the etiology of myositis ossificans it is necessary to review the family histories of the patients. Unfortunately in many cases this has not been mentioned or only very shortly so, but I think we may fairly assume that in such

FIG. 2.

The skeleton of William Clark, in the Museum of Trinity College, Dublin.

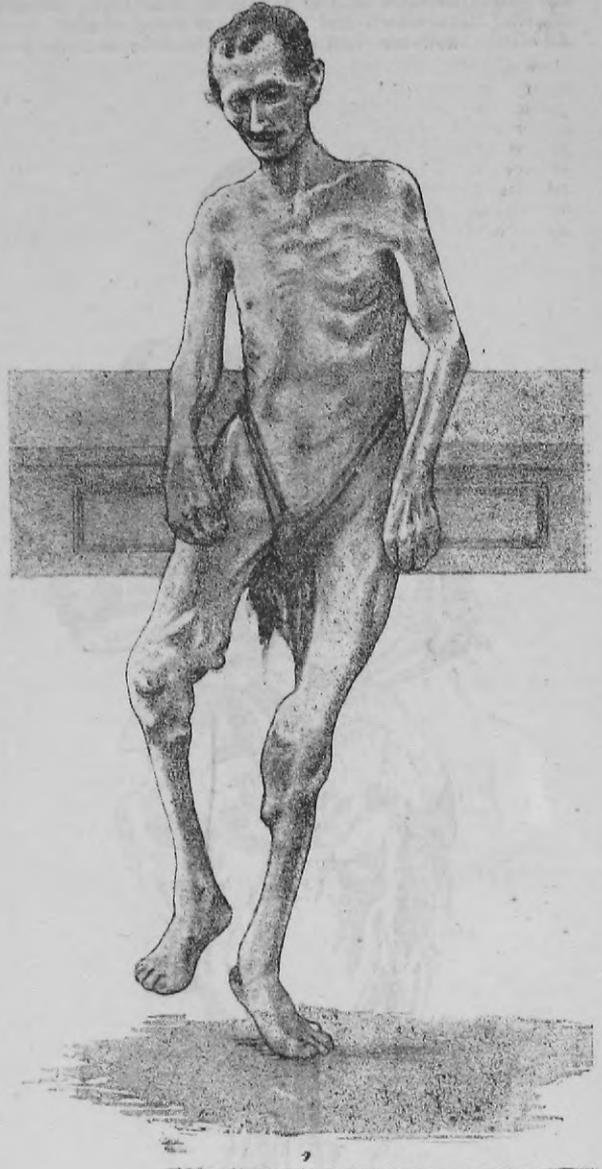

constitutional predisposition to the formation of new bony tissue, we are not carried very much further, since we know nothing as to the nature of such predisposition or of the causes which induce it. In endeavouring to elucidate this

cases there was nothing noteworthy in the history, as all the recorded cases are by good observers who would pay full attention to any important feature of the case. It would appear that in some cases at least there was a distinct famil-

history of rheumatism (Lendon, Sympson) and in many the onset or progress of the disease was very similar to muscular rheumatism. In Henry's case the disease began with acute arthritis of the wrist and elbow; Minkewitsch met with the disease in a girl following rheumatic arthritis of the left knee. In nearly all the cases rheumatic pains are complained of. Hawkins was of opinion that the disease was of a rheumatic nature. Lieutaud held a necropsy on a case of myositis ossificans, the patient having always suffered from rheumatism. The onset of the symptoms has in many cases, as in rheumatic affections generally, clearly followed exposure to cold or a chill. Thus Hawkins' case began in the loins of a patient twenty-two years of age after getting wet through. Testelin and Danbressi relate that in their case the patient had always worked in a damp cellar, under conditions strongly favouring rheumatism. On careful perusal of the published cases of myositis ossificans one is struck with its close resemblance in many leading respects to muscular rheumatism, even if it be not a phase of the disease itself. At the same time, as Haltenhoff justly points out, the analogy between rheumatic affections and myositis ossificans is incomplete and in some important particulars the diseases differ widely. Thus in myositis ossificans the joints never show any post-mortem evidence of disease nor are there any of the visceral lesions seen in rheumatism and the general health remains good. The chief points of resemblance are that both are essentially chronic diseases, liable to advance by periodic more or less acute attacks; both lead to muscular degeneration, rheumatism to fibroid change and myositis ossificans to bony growths with a minimum of fibrous tissue. In this respect it is worthy of note that in chronic rheumatic arthritis numerous bony outgrowths occur at the articular margins.

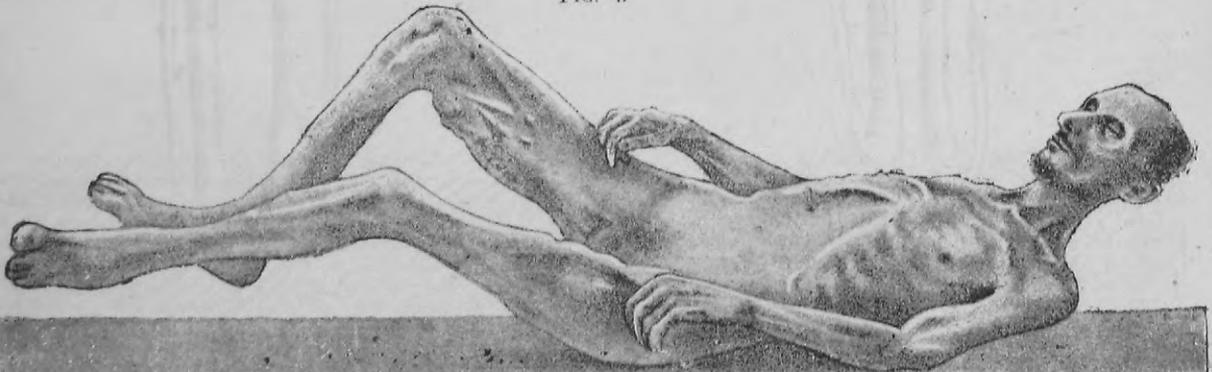

With regard to the relations of myositis ossificans to other diseases I have been unable to trace any. In one or two cases there was a family history of phthisis and in one case related by Bókay the disease was associated with rickets. The majority of cases of myositis ossificans occur in the male sex, the proportion being four or five males to one female. Pinter, however, thinks it probable that if all cases met with were recorded this preponderance of the male sex would be diminished, and even suggests that there might be found "an unfavourable balance on the female side." I am unable to find on what grounds Pinter bases this opinion, which appears to be diametrically opposed to what we already know. The effect of injury in the production of the disease and of periodic acute attacks is important. Billroth and Zollinger's case began after a violent fall upon the hands, Munchmeyer's after a fall on the back. In Lendon's case the first evident signs of the disease were said to be due to chastisement with a ruler and trivial injuries certainly produced subsequent inflammatory swelling followed by ossification. Skinner notes that injury always caused a lump to appear, but that the disease began independently of injury. Helferich and Partsch report that their cases arose from injury and that successive attacks were directly traceable to it. Abernethy mentions the case of a boy in whom an ossific lump always followed a trivial injury. Pinter denies that injury is a causative factor in myositis ossificans on the ground that injuries are very common and the disease is very

FIG. 3.

Dr. Lendon's case of myositis ossificans.

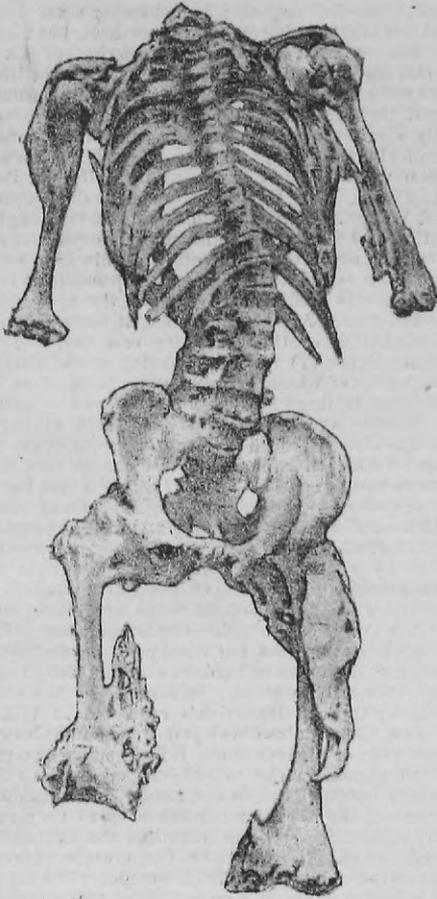

FIG. 4.

rare; but, as pointed out by Lendon, it is the peculiar constitutional diathesis which leads to such untoward results from otherwise harmless injuries. Pinter in support of his opinion mentions that in many cases, carefully watched by competent observers, there was no evidence connecting myositis ossificans with injury. On the other hand, we have numerous examples by equally good observers showing the contrary and while freely admitting that injury is not a necessity as a causative agent, it cannot be doubted that in some cases at least it plays an important subsidiary action. Nicoladoni and Hayem suggested that the condition was dependent upon central changes in the spinal cord or in the peripheral nerves. Schultze has, however, conducted investigations on this point in two cases with negative results. In one case he found the spinal cord of good size and well-developed and microscopic

misleading and it would be more correct to speak of the disease as an interstitial myositis ossificans. It is a noteworthy fact that the disease begins first in the muscles of the back and neck, the favourite sites of ordinary muscular rheumatism. Affecting the latissimus dorsi and the trapezii, with the rhomboids, deeper back muscles and muscles of the neck, the disease gradually spreads to the limbs. First affecting the muscles of the shoulder and the pectorals, the scapulae become fixed to the chest and the arm is rendered useless. The upper limb is affected in most cases in advance of the lower and the disease spreads from the proximal to the distal end. By the gradual ossification of the pectorals, latissimi, trapezii &c. the chest becomes enveloped in a dense bony cuirass, so that the thoracic respiratory movements are much hampered or altogether lost (Skinner, Minkewitsch.) This fixity of the chest is increased

FIG. 5.

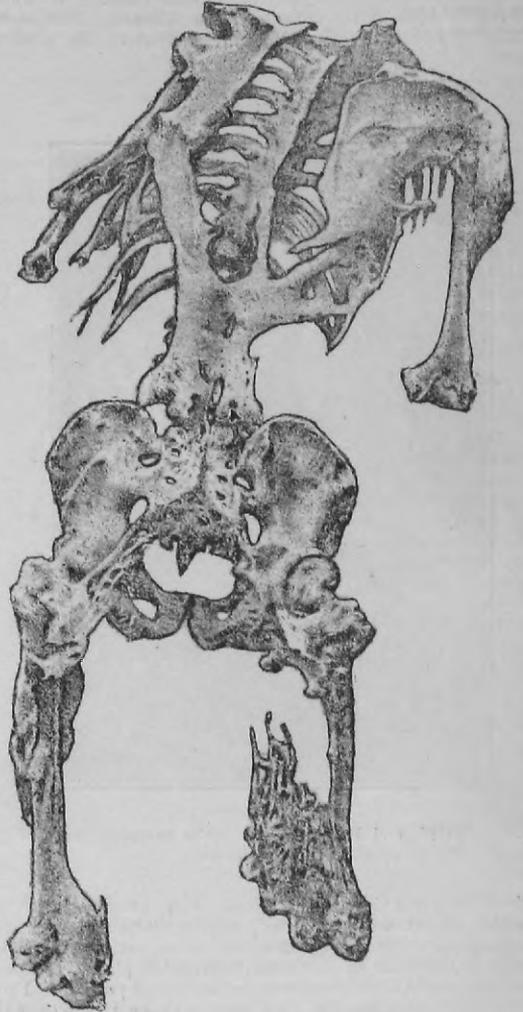

Dr. Lendon's case.

examination showed nothing abnormal. In Munchmeyer's case Schultze examined the cord and peripheral nerves with a like result. In Lendon's case the cervical cord was examined, but this "revealed nothing unusual except a sprinkling of corpora amylacea."

*Pathological anatomy.*—That ossification may take place in muscles which from long continued irritation have been the seat of chronic inflammation is well known. Ossification of the adductors of the thigh in cavalry soldiers and occasionally in shoemakers and the drill bone in the deltoid of the old Prussian infantry are cases in point. Such instances have, however, nothing to do with myositis ossificans. It is well established by many observations that myositis ossificans is primarily a disease of the cellular tissue binding the muscular bundles together; the muscular tissue itself takes no active part in the process, but undergoes degeneration and atrophy. The name therefore is open to objection and

FIG. 6.

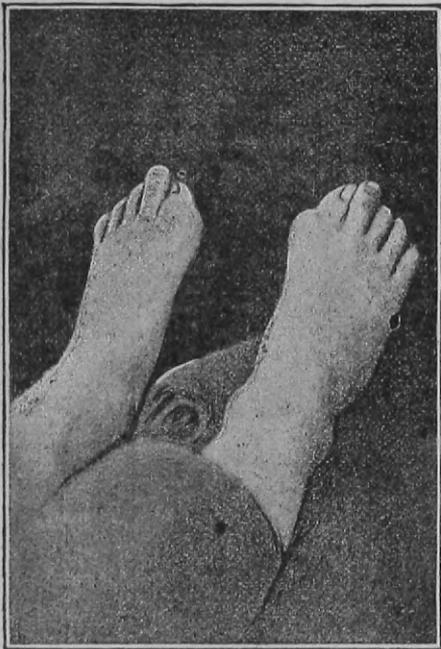

Dr. Lendon's case.

by ossification of the costo-vertebral ligaments (Lendon). The muscles of the abdomen, the diaphragm and those essential to life are hardly ever affected and then only to a small extent. When the muscles are first attacked there is only a sense of stiffness; this, however, gradually increases, the hardness of the parts becomes more marked, bony masses in adjacent muscles fuse and the rigidity is absolute, the patient in advanced cases being rendered almost as rigid and helpless as a block of marble. In the case of the spinal column it is not infrequently deprived of all movement and curved to one side or to the other; this is in part due to the ossific plates in the muscles, but more especially to ossification of the various ligaments and synostosis of the vertebrae, as well shown in

Lendon's case. The joints become fixed, not by true bony ankylosis, but by the rigid bars of bone formed in the substance of the muscles acting upon them. I cannot find any mention of actual disease of the joint surface. Lendon records that in his case the joint surfaces were but slightly altered—"the hyaline cartilage was replaced by a fibroid substitution and in the left knee it was slightly uneven and the condyles were soft and spongy." The position of the limbs and joints varies according to the muscles affected. Ossification of the muscles of the neck and of the vertebral ligaments renders the head fixed and slightly flexed by involvement of the sterno-mastoids. The muscles of mastication are frequently affected, the lower jaw becoming completely immobile, so that the patient can only be fed through a gap in the dental arch (Testelin and Danbressi) or after the removal of a tooth for the purpose (Helferich, Munchmeyer). In Bókay's case the ocular muscles were affected and Billroth and Zollinger found a calcareous plate in the choroid coat of the eye.

A glance at the accompanying figures (Nos. 1 to 6) will give a good idea of the extent of the disease. The osseous formations are many of them independent of the skeleton,

FIG. 7.

M etyl and hallux valgus. (Mr. Sympton case of myositis ossificans.)

but in some parts they are attached to it, spreading into the muscular insertions as pointed, stalactite-like masses. As already stated, true spongy exostoses are sometimes met with. Usually in the form of flattened, perforated plates, the bony tissue may be in nodular masses or sharp and pointed. From pressure and irritation the skin and cellular tissue over the affected muscles may slough, forming large, foul sores, adding much to the sufferings of the patient and exposing him to the risk of septic absorption. In Lendon's case the discharge from these sores contained gritty portions of bone and small sequestra. Sometimes large, deep abscesses are met with, doubtless due to the irritation set up by the sharp spiculae of bone (Rogers). The bone found in myositis ossificans has been examined microscopically and chemically by some observers, the results in each case being similar. Dr. Poggiale made a chemical examination of a dried portion of the new bone and found that in 100 parts there were 58 per cent. of organic matter and 42 per cent. inorganic, accounting for the comparative softness of the bone as compared with normal osseous tissue. Of the organic material he found cartilage 54.3 and vessels 3.70, while the inorganic part consisted of

calcium carbonate 8.66, calcium phosphate 32.09 and magnesium phosphate 3.25. Poggiale was unable to find any traces of alumina, silica and the oxides of iron and manganese which have been described by Bazellius, Fourcroy and Vaugelin. Hawkins examined a portion of bony material which he removed by operation from the back of his patient. He found that the muscular fibres were inserted into it just as muscles are inserted into skeletal bones. The piece removed consisted of firm bone, but a small piece was cartilaginous; it was covered with periosteum and consisted of an outer firm shell and an inner cancellous spongy tissue. Microscopically it presented the characters of true bone. Hamilton also found the new tissue chemically and microscopically like true bone. This skeleton is in the museum of Steevens's Hospital, Dublin.

With regard to visceral lesions, I am unable to find any mention of pathological conditions which could in any way be associated with this disease, nor should we, seeing that the general health remains good, expect otherwise. In most cases the urine is reported as being normal. Pinter records a quantity of brick-dust deposit; Munchmeyer notes a diminution of the quantity of phosphates by one-half, but adds that the urine was only examined over a period of six days. Pinter in one case recorded by him states that the lime and phosphates were diminished to one-tenth of the normal, and in a second that kreatinin, lime and magnesia salts were "decidedly diminished." A curious and rare congenital deformity of the thumbs, great toes or both has been noted in connexion with myositis ossificans by Helferich, Partsch, Kümmell, Pinter, Von Gerber, Uhde, Lendon, Sympton, Godlee and Willett. Helferich appears to have thought this rare condition of hallux valgus and microdactyle was a mere coincidence, but since the publication of his case so many others have been noted that it seems impossible to suppose that coincidence is sufficient to explain the association of two rare conditions. At the same time, it must be admitted that no explanation of the connexion can be given. The accompanying figure (7) is from a photograph of Sympton's case, in the report of which he says "the head of each first metatarsal bone is large and prominent and the great toe on either side is small, apparently consists of only one phalanx and is directed towards the outer border of the foot." In this case no mention is made of any similar condition of the thumbs as mentioned by Godlee, Helferich and Partsch.

*General symptoms.*—The general health of those suffering from myositis ossificans usually remains good. The onset of the disease and of fresh attacks is in most cases, but not in all, accompanied by slight fever, general malaise, pain (often severe), tenderness and swelling of the part attacked. The swelling is red and the superficial veins are engorged. In a few days the symptoms subside—the temperature falls, the swelling diminishes but does not disappear, permanent stiffness remains and the exudate hardens and gradually becomes transformed into a bony mass. In some cases the onset is more insidious; thus in Helferich's case and in Willett's, reported above, the nodules developed in the muscles of the back without pain or obvious acute inflammatory symptoms. The lymphatic glands in the neighbourhood of the affected part frequently become swollen and tender, but subside with the subsidence of the irritation; in other cases they remain permanently enlarged. In some instances the inflammatory exudate is converted into scar tissue, the muscle undergoing fibrous but not bony change. Fibrillar contractions are often seen in the affected muscles, due doubtless to the irritation caused by the bony plates. Munchmeyer records in his case a sensation of coldness in the limbs with actual loss of temperature. Oedema is not uncommon. The subjects of myositis ossificans are, on account of the impeded thoracic movements, especially liable to chest affections and not a few of them die of pneumonia or phthisis. Later on in the disease, when bed-sores and ulcers have formed over the bony projections, the general health suffers severely from the prolonged and profuse discharge, accompanied by repeated septic absorption.

*Treatment.*—In spite of all treatment the disease makes steady progress and nothing has so far proved of any real value. Improvement due to treatment must not be confounded with remissions and temporary quiescence of the disease. Mercury, iodide of potassium, sarsaparilla, iron, mineral acids, colchicum, arsenic, phosphorus and numerous drugs have been found useless. Munchmeyer found that the induced current did harm. Baths have in some few cases been followed by temporary benefit. Rogers endeavoured to induce by a salted diet a condition similar to scurvy. Under

this treatment it is related that some of the bony nodules became absorbed, but the patient suffered so much in health from the treatment that his condition was rendered worse than before. In Hawkin's case local blistering always did good, the pain and swelling being relieved; but he does not state that it arrested the bony formation. The avoidance of cold, damp and especially injury seems specially indicated. Further than this, the patient must be treated on general principles. Excision of the bony nodules does no good.

*Conclusions.*—1. The disease is associated with a congenital, but not hereditary, predisposition to the formation of bone in inflamed parts. 2. It is closely allied to muscular rheumatism and rheumatoid arthritis. 3. It runs an essentially chronic course over many years, steadily progressing, but with distinct remissions, and may extend over a long period, beginning usually in early life, especially in the male sex. 4. The muscles of the back and shoulders are the earliest and most extensively affected; those muscles of great importance to the life of the individual almost always escape. 5. Local injury must be accepted as a great causative factor in producing fresh foci of disease. 6. It is sometimes associated with hallux valgus and microdactyle. 7. Death usually occurs from pulmonary complications or suppuration and sloughing with septic absorption. 8. Treatment is useless.

Harley-street,

## A CASE OF MYOSITIS OSSIFICANS.

BY BILTON POLLARD, M.B. LOND., F.R.C.S. ENG.,

ASSISTANT SURGEON TO UNIVERSITY COLLEGE HOSPITAL AND SURGEON TO THE NORTH-EASTERN HOSPITAL FOR CHILDREN.

A BOY aged nine years was brought to me at the North-Eastern Hospital for Children in July, 1891, with the request that, if possible, something might be done to increase the mobility of his neck and his arms, which were very stiff. His mother gave the following account of his disease. When he was six months old the child was brought to the North-Eastern Hospital for Children because a lump was forming on the lower angle of his right scapula. No operation was performed. Six months later several nodules began to appear on the boy's ribs. During his second year his right arm began to get fixed and the lump on his scapula increased in size. About this time it was noticed that the boy's neck was getting stiff, but no bony masses were detected in it. During his third year a hard lump began to form between the right iliac crest and the last rib and the other nodules increased slightly in size. During his fourth year the boy fell and cut his right knee. The wound healed quickly, but a hard nodule formed a little below and to the right of the patella. The boy's neck became a little stiffer and was carried rather forwards, but as yet no hard bands were detected in that region. One or two lumps appeared about the inferior angle of the left scapula and one above the left iliac crest. During his fifth year the range movement of the boy's left arm became restricted and he began to have difficulty in bending his back. During his sixth year his neck got stiffer and bony bands along the front of his neck were then noticed for the first time; fresh nodules were also observed on his ribs. During the seventh, eighth and ninth years no fresh bony growths were detected; but the stiffness of the boy's neck and back and the limitation of the movements of his arms increased, and now he began to walk stiffly. The boy's general health had always been good; his appetite was good and he slept well; he had had whooping-cough, chicken-pox and measles, but not scarlet fever; he had not had rheumatic fever and he had not complained of pains in the muscles affected. The family history was very good; the boy's father and mother were both strong and healthy, as also were their three other children. The boy is continually falling on his face, for if he trips over anything he cannot prevent his fall, and if he does he cannot protect his face owing to the stiffness of his arms.

*Present state, July 8th, 1891.*—The boy walks slowly and very stiffly. He can stand quite steadily, but a very slight push is enough to upset him. The movements of his head are extremely limited both upwards and downwards and to either side. His head can only be rotated enough to bring his chin to a vertical line carried upwards from the sternoclavicular articulations and his chin cannot be raised or depressed more than a quarter of an inch. His neck is quite stiff. The skin between the chin and the sternum stands off in a prominent fold and close beneath it there is a bony band. This band commences above in an irregularly shaped boss of bone about the size of a walnut, which is fixed to the inferior border of the body of the lower jaw just to the right of the symphysis and extends as a rounded hard cord to the right of the cricoid cartilage, where it expands into a flat bony plate which extends across the middle line. From the angles of this plate below there pass two bony cords, that on the right side terminating in a rounded knob just above the sternoclavicular articulation, whilst that on the left side takes a more oblique course and ends in a similar manner just above the clavicle, opposite the interval between the two heads of the sterno-mastoid muscle. Both sterno-mastoid muscles stand out prominently and are very firm, but no spicules of bone can be felt either in them or the lateral muscles of the neck. The right arm can be raised from the trunk through an angle of 45°, but with this limited range of abduction the scapula moves too. The arm can be brought to the side, but it cannot be carried backwards beyond the posterior axillary line; it can be carried forwards for about 45°. The restricted movement appears to depend on the contracted state of the muscles in the axillary folds. Along the posterior axillary fold is a scar one inch and a half in length, which resulted from an operation performed at the Holloway Hospital, where a piece of bone was removed when the boy was in his third year. Beneath the scar there is a bony plate, which

commences below in a mass of bone continuous with the inferior angle of the scapula and extends upwards nearly to the bicipital groove. It appears to be situated in the latissimus dorsi muscle; it is slightly movable. The lower border of the pectoralis major muscle is shortened and feels like a dense fibrous cord. There is a hard swelling on each of the rib cartilages where the muscle arises from them. The fibres of the deltoid muscle are very tense and their outline is plainly visible beneath the skin, but no masses of bone can be felt in the muscle. The outer bicipital ridge is very prominent. The movements at the elbow-joint are not restricted. No bony spicules can be felt in the muscles of the upper arm and the only mass which can be detected in the forearm is situated on the radial border about two inches above the styloid process. It is an oval mass measuring about one inch in length and half an inch in breadth; it has no bony attachment to the radius; it is slightly movable from side to side and appears to be situated in the lower part of the supinator longus muscle. The fingers and thumb can be moved freely. The left arm, like the right, can only be raised 45°, but it cannot be brought to the side of the body. It cannot be carried forwards beyond the mid-axillary line, but it can be extended for the normal distance. In the situation of the teres major muscle there is a thick band of bone which extends from the inferior angle of the scapula almost to the humerus, but it has no bony attachments either to the latter or to the scapula. At the bend of the left elbow there is a projection formed by an irregular nodale of bone about the size of a Barcelona nut; this appears to be connected with the biceps tendon. Still deeper there is another mass, which seems to involve the lower fibres of the brachialis anticus muscle. With these exceptions the muscles of the upper arm, forearm and hand of the left side are unaffected.

The spine is very rigid throughout and it is only in the lumbar region that any mobility can be made out. Just to the left of the fifth and sixth dorsal spines and probably in the lower fibres of the trapezius muscle there is a rounded plate of bone measuring about three-quarters of an inch in length and half an inch in breadth. On the left side there are several small bony nodules situated apparently in the latissimus dorsi muscle, and three of them are fixed to the ribs and seem to occupy the slips of muscle which arise from them.

On the right side of the spine in the lumbar region there is a flat plate of bone which is movable from side to side. It extends from just above the crest of the ilium to the last rib and laterally from just to the right of the middle line outwards for about two inches. It appears to occupy that part of the aponeurosis of the latissimus dorsi muscle which blends with the posterior layer of the fascia lumborum. The anterior border of the latissimus dorsi muscle stands out prominently, and in this situation, close beneath the skin, there is a large mass of bone of very irregular shape, which is attached below to the crest of the ilium and extends upwards rather behind the mid-lateral line of the trunk and overlaps the ribs above. Slightly above and behind this mass there is another one of much smaller size; it is movable from side to side. No bony masses can be felt in the muscles of the anterior abdominal wall. The movements of the hip-joints are impeded in all directions. No bony plates can be felt in the muscular fibres of the glutei; but just below the great trochanter, on the outer and back part of the right thigh, there is a flat plate of bone about three inches in length and one inch in breadth at its widest part. It lies close beneath the skin and is slightly movable. It appears to occupy the fascia lata of the thigh, where the lower fibres of the gluteus maximus are inserted into it. There is a smaller plate of bone on the left side in a similar situation; it is apparently continuous with the femur. No bony masses can be felt in the muscles of the thighs, but in each there is a strong spicule of bone extending from the adductor tubercle upwards for about two inches in the tendon of the adductor magnus. They are both firmly fixed at their lower ends. There is a movable plate of bone of irregular shape, measuring about three-quarters of an inch in diameter, situated between the lower end of the condyle of the left femur and the patella; and there is a smaller movable plate of bone just above and in front of the outer tuberosity of the right tibia. Both these plates of bone appear to occupy the fibrous expansion derived from the extensor muscles. The knees cannot be fully extended, but flexion is free. The inner borders of both tibiae present bony growths just below the tuberosities. The boy's parents were anxious that if possible something might be done to give him freer movement of his left arm and his neck.

On July 21st, 1891, an incision was made along the anterior

border of the osseous band in the left posterior axillary fold. The teres major muscle was exposed and the bone was found to occupy the substance of this muscle in nearly its whole extent, but it was not fixed either to the scapula or the humerus. It was dissected out. The mobility of the arm was a little increased. The bones were also removed from the front of the neck. They were superficial to the deep fascia and apparently in the platysma muscle. The mobility of the neck was not at all improved owing most probably to ossification of some of the posterior muscles of the neck. The bones removed had the naked eye appearances of physiological osseous tissue. They were unfortunately mislaid before a microscopic examination of them had been made. The increased mobility of the left arm which was obtained by the operation was soon lost.

The boy was examined again on Dec. 24th, 1891. He had got stiffer and more bony. Bones had formed again in both the situations from which they had been removed. In the neck there was a strong spicule of bone, which was attached to the inferior border of the lower jaw just to the right of the symphysis and extended to just above the right sternoclavicular articulation below. Its lower extremity was free. It was situated immediately beneath the skin. The right arm could only be abducted 15°, flexed 15° and extended just beyond the mid-axillary line. In addition to the plate of bone previously noticed in the posterior axillary fold there was a large flat bony plate occupying the greater part of the pectoralis major muscle. It was not fixed by bone either to the thorax or the humerus.

The left arm could be abducted 45°, flexed 15° and extended 45°; the muscles of the anterior axillary fold were very small and firm, but no bony deposit could be felt in them; the posterior axillary fold was occupied by a bony mass, which commenced in an irregular nodule attached to the inferior angle of the scapula and extended forwards almost to the humerus, but was not attached to it; the bone lay immediately beneath the scar of the wound, through which a similar plate of bone had been removed fifteen months before.

Harley-street, W.

## A Mirror

OF

## HOSPITAL PRACTICE, BRITISH AND FOREIGN.

Nulla autem est alla pro certo noscendi via, nisi quamplurimas et morborum et dissectionum historias, tum aliorum tum proprias collectas habere, et inter se comparare.—MORGAGNI *De Sed. et Caus. Morb.*, lib. iv. Proœmium.

### MIDDLESEX HOSPITAL.

CASE OF MULTIPLE VISCERAL INJURIES OCCASIONED BY A CRUSH, WITH TRIVIAL MARKS OF VIOLENCE ON THE SURFACE OF THE BODY.

(Under the care of Mr. HULKE.)

THE occurrence of severe visceral injuries inflicted by external mechanical violence, unattended with manifest or concurrent or with but very trifling marks on the surface of the trunk, is a circumstance frequently noticed by writers on military surgery. This class of injuries probably occurred more often in bygone years when spherical cannon shot discharged with relatively low velocity was employed. It is well-known that modern authors are agreed that probably most of the instances of death popularly ascribed by soldiers and bluejackets to the effects of the "wind" of a closely passing cannon shot are, in fact, due to actual impact of an almost completely spent ball on the combatant's body. Typical examples were seen in the course of the siege of Sebastopol. In two of these, brought to the "General Hospital in the Front," the clothes were but slightly damaged and the abdominal wall bore no mark of injury; but the liver and spleen were comminuted into pulp and the intestines much lacerated. Perhaps in the larger number of such injuries the abdomen is the region implicated, but the thorax also offers examples. Thus amongst many men wounded by the explosion of a large magazine at Inkermann and the heavy firing which imme-

diately followed this, who were brought to the General Hospital, was a private in a British Line regiment whose left arm was shattered by a piece of an exploding shell. Large quantities of bright frothy blood oozed bubblingly from his mouth, nearly choking him, for he had barely strength to cough and he could only speak in a scarcely audible, broken whisper. Yet two small lacerated wounds in the integument near the lower angle of the scapula were the only marks of violence on the outersurface of his chest. He succumbed about twenty-four hours after receiving the injuries. At the necropsy these wounds were found to be superficial and not to penetrate the chest wall. The costal pleura was not torn, but it was found entire over two transversely fractured ribs. The lung, however, was extensively torn by large rents which passed from its base upwards and from its outer surface towards its root, opening large bronchi and bloodvessels. It is suggested that this very extensive damage was caused by forcible compression of the chest at the moment of full expansion of the lungs by the shattered arm violently driven against the chest wall. In civil life similar injuries are not unfrequently caused by machinery; by the buffers of two railway carriages nipping an incantions porter whilst coupling; or by a person being squeezed against a wall by the nave of a dray. In the following case very extensive fatal lacerations of several abdominal organs were produced by a crush which the sufferer inadvertently brought on himself in a manner that recalls a mode of execution judicially decreed in the early Middle Ages as the penalty for crimes regarded as peculiarly atrocious, and known as "pressing to death"—the *pains forte et dure*.

W. C.—, aged thirty-seven years, was admitted into Founder ward on June 22nd, 1892, in the early forenoon. The surface of his body was bedewed with beads of cold sweat, the temperature was distinctly subnormal, the pulse was 100°, very small and weak, and the pupils were dilated and motionless. He was perfectly conscious and complained of great pain. In short, his condition was extreme collapse. Across his back, over the lower ribs, particularly on the right side, were grazes. Lying on his right side this side of the abdomen was non-resonant when percussed. Lying prone under a lift for the purpose of oiling the cylinder piston he had inadvertently set the cage in motion, and this descending had crushed him upon the floor before he could extricate himself. A workman who went to his aid and reversed the cage said that the space between the bottom of the cage and the floor could only have been a very few inches. The house surgeon gave a subcutaneous injection of sulphate of ether and ordered small quantities of brandy to be given at intervals regulated by its apparent need. He also passed a catheter and drew off half an ounce of clear normal urine untinged with blood. The man said that he had emptied his bladder about twenty minutes before the accident. His condition continued without notable change throughout the day. At 8 P.M. the catheter (a soft red rubber one) was again passed and two drachms of slightly blood-tinged urine drawn off. Next morning (June 27th) the collapse appeared rather less extreme. He had great thirst and his abdomen was tympanically swollen, except the right side, which continued dull. At noon one ounce of normal urine was removed with a soft catheter. In the afternoon he sank and died at 5 45 P.M. The extreme collapse; significant waxy, bloodless appearance of the skin and also of the buccal mucosa; coupled with the dullness of the most dependent part of the abdomen—the right side—and the great thirst clearly indicated an extensive internal hæmorrhage. In face of such profound collapse and of the great probability, from the manner of the accident, that the damage was not limited to a single organ or part, but was multiple, laparotomy for discovery of the source and the arrest of hæmorrhage could not be entertained. The case was considered hopeless from the first and the following details of the post-mortem examination leave no doubt of this.

At the necropsy made by Dr. Voelcker abrasions were noticed on the lower limbs and on the lower part of the abdomen and loins. Both eighth ribs were fractured. The right pleural sac contained twelve ounces and the left eight ounces of blood. The peritoneal sac contained forty-six ounces of fluid blood. The spleen was lacerated on its inner and posterior aspect above the hilus. The right lobe of the liver was extensively lacerated both on its upper and on its lower surface. The right kidney also was lacerated and the loose tissue around it was distended with blood, which had crept upwards behind the diaphragm and gained entrance into the pleural cavity near the root of the lung. The left supra-renal capsule was distended with blood-clot.

## LANCASHIRE COUNTY ASYLUM.

CASE OF GLIOMA OF THE CORPUS STRIATUM (LENTICULAR NUCLEUS) WITH MELANCHOLIC SYMPTOMS, ENDING IN UNILATERAL CONVULSIONS WITH HYPERTHERMIA.

(Under the care of Dr. COWAN, assistant medical officer.)

CASES of mental alienation arising from the development of cerebral tumours are not at all common. By mental alienation we mean such a degree of psychical disturbance as necessitates the incarceration of the unfortunate subject in an asylum. Authorities differ as to the relative frequency with which cerebral tumours are found in insane people and differ widely. Thus Clouston gives the proportions (quoting from various sources) of from two to twenty-eight cases out of 1000, which latter proportion has been his experience. Bucknill and Tuke, Bristowe and Griesinger, mention neoplasms as a cause but do not go into details as to frequency. Savage says: "It is rare to meet with insanity directly depending upon a growth within the skull. Among several thousand patients in Bethlem only one exostosis and syphilitic tumours have been met with post mortem."<sup>1</sup> As to the frequency of psychical disturbance arising in cases of cerebral tumour experiences also vary. Thus Andral and Durand Fardel assert that this occurs very seldom. Calmeil and others say that some form of mental alienation is present in from one-third to one-half of their cases. At this asylum, out of a very large number of patients treated during the last few years, it is comparatively rare to meet with cases of cerebral tumour and still rarer that it is certain the tumour is the cause of the mental disorder. Taking the statistics of the last five years, out of 14,969 persons under care during this period eight times only has a tumour been found—namely, in 4 males and 4 females. In three of these instances no definite symptoms were developed and the presence of the tumour was probably only accidental and not the exciting cause of the insanity. Even considering that in all the eight cases the tumours were the exciting causes the proportion is exceedingly small—i. e., 0.53 in 1000, or roughly 1 case in 2000. In earlier years the proportion is even less than this. In 7 out of the 8 cases the growth was a glioma or a sarcoma. With regard to the symptoms of this case several points seem of interest: 1. The rather long history—nearly two years and nine months. 2. The slight symptoms produced by the growth, probably due to its position, as it was only when pressure was exerted on the internal capsule that definite symptoms were produced. The more or less constant fixed headache, which was rarely acute, unaccompanied by nausea or vomiting and the slight attacks of giddiness. The hemiplegia, due evidently to the pressure of the slowly growing growth on the internal capsule and affecting both the motor and the sensory tracts. The absence of any other focal signs and of optic neuritis at any stage of the development of symptoms. 3. The occurrence of the unilateral fits at irregular intervals and of great severity on two occasions. The early occurrence of the status epilepticus with high temperatures. These convulsions seem to have been due to the pressure on the internal capsule and not to any pressure on the motor convolutions causing irritation and therefore discharges of motor impulses. The almost simultaneous affection of all the muscles involved also points to a uniform pressure on the posterior limb of the internal capsule. There was no evident reason why the fits should occur, or why they should be so severe on the two occasions—no hæmorrhage having apparently occurred into the tumour at these times. 4. The growth did not involve the internal capsule itself so far as could be ascertained by careful examination with the naked eye and with the microscope. The internal capsule simply being slightly pressed upon, as the gliomatous tissue did not extend beyond the middle of the inner part of the lenticular nucleus. 5. Speech was slow and drawing, but it was doubtful whether this was not a natural characteristic and not a result of the disease. It was thought at first that the case was probably one of early general paralysis of the insane, but more extended observation and especially the occurrence of the peculiar convulsions rendered this very unlikely. The diagnosis of a slow-growing new growth and probably one in the region of the right corpus striatum was then made, which proved to

<sup>1</sup> Insanity and Allied Neuroses.

be correct. From these few and somewhat unusual features, but more especially from the definite causation of melancholic symptoms by a new growth, a result by no means common, we have ventured to think that the case is an interesting one. In conclusion we have to thank Mr. Rooke Ley, the medical superintendent, for his kind permission to use the notes of this case.

A clerk aged twenty-six years was admitted to hospital on Nov. 20th, 1891. His family history presented nothing of importance and there was no history of insanity or of organic nervous disease in the family. He had never had a day's illness till two years ago and had not suffered from any kind of venereal disease. He first complained of headache a little over two years ago, which was intermittent at first but soon became constant and gradually increased in severity: a dull never-ceasing aching in the frontal and right temporal regions. No vomiting at any time. For the last few months he had noticed a gradual weakening of the left arm and leg. He says that he had two fits—of an epileptiform character, from the description—shortly before admission. He gave but a very imperfect account of himself during the last year. He had been in several situations, but had to give them up on account of the increasing pain in his head interfering so much with his powers of working steadily. He had been depressed and fearful for two months before admission, and to drown his sorrows had taken to drinking spirits. This rendered him more and more melancholic, dull and stupid, and he became delusional and developed suicidal tendencies. Measures were therefore taken for his removal to an asylum. The medical certificate stated: "He is dull and depressed and complains much of headache. He says 'that he is trying to discover perpetual motion.' He wishes to put his head under an express train to cure both the headache and enable him to discover perpetual motion."

On admission the patient, a tall and muscular young man, had a frowning look, as if in pain. He was dull and miserable and complained much of a constant aching pain in the forehead and right temple, which at times became very acute. He never had any nausea or actual vomiting, but was giddy at times. The thoracic and abdominal viscera were normal; urine acid, sp. gr. 1024, contained no albumen or sugar; clear without deposit. Nervous system: There was slight left hemiplegia, involving the tongue, face, arm and leg, both motor and sensory paths being affected. The motor loss, although slight, was, however, very noticeable on comparing the two sides of the body; it affected equally the parts of the side involved. Sensory affection: Hemi-anæsthesia was also slight but well definable and of equal distribution, sensation over the left half of the body being distinctly dulled and delayed for every kind of stimulation. There was no apparent difference between the two sides with regard to the organs of special sense—sight, hearing or taste. Eyes: No affection of the ocular muscles, range of movement being good; no nystagmus. Pupils equal, of medium size and reacted well to light and accommodation. Ophthalmologically the fundi were normal. No sign of any papillitis, old or recent. Vision =  $\frac{5}{6}$ . Fields of full extent. Colour vision normal. Superficial reflexes badly marked on the left side, the plantar and abdominal being only just present. Deep reflexes: Both knee jerks brisk, the one on the left side being especially so; tendon jerks in the left arm fairly easily obtained; no cloni. Speech was rather drawling and hesitating, but this seemed natural to him; articulation good. Mentally he was dull and depressed. He feared some vague impending evil and thought that he was "done for" and meditated suicide. He begged pitifully for his life, as he fancied that he was being fattened up to be killed at Christmas. His memory was very deficient with regard to recent events and he could therefore give but a very imperfect account of himself.

On Nov. 28th it was noted that he had a severe fit, apparently of an epileptiform nature. It was uncertain how the fit began, but it consisted for the most part of clonic convulsions of the left side of the body. Consciousness was lost for a few minutes. No rise of temperature was noted. After the fit the patient complained much of giddiness and of severe headache. His condition remained unaltered for the next two months. He always complained bitterly of the constant wearing pain in the right side of the head, which, however, was not severe enough to disturb his rest much. His face always wore an expression of pain and he was constantly frowning and half-closing his eyes as if blinking at a strong light. He had, however, no photophobia. The loss of power and of sensation did not seem to further increase. Mentally he remained dull and miserable, although he bright-

ened up somewhat at intervals; was rather vacant and listless, with slow mental reaction. He was ordered thirty grains of bromide of potassium three times a day and for a time he took iodide of potassium, but without benefit. In the evening of Feb. 3rd, 1892, he had a series of seventeen epileptiform fits in about two hours. There was no aura, the patient becoming convulsed and falling to the ground, consciousness being lost very soon. The convulsion began in each fit in precisely the same manner: (1) Strong conjugate deviation of eyes and head to the left, followed almost instantly by (2) tonic contractions of the left side of the face, the left arm and left leg. The tonic contractions lasted a few seconds and were followed by (3) clonic convulsions of the same parts. Each fit lasted about four minutes and was followed by an interval of about two minutes. The convulsion appeared to begin in all parts of the left side of the body almost at the same instant, there being no appreciable interval. The face was very livid and bloated and the surface of the body generally was dusky and bedewed with sweat. The temperature slowly rose until it gained a maximum of 103.8° towards the end of the fits. Consciousness was not regained during the continuance of the fits, the conjunctival and other reflexes remaining absent until some time after the occurrence of the last fit. The right side was not involved. The power of swallowing was not lost and chloral hydrate was given by the mouth, two doses of thirty-five grains, each at an interval of forty minutes. Soon after the second dose the severity of the fits diminished and the interval between them became longer until they finally ceased. The knee jerk and other tendon jerks on the left side were abolished for a short time. There was no increase of paralysis on the left side after consciousness was regained, although there had been for a short time after the fits had ceased.

Feb. 20th.—It was noted that he has had no return of fits but still suffers from headache, which is very persistent, and he is much as usual. Is still dull and despondent, but rather less so than he was. The physical signs are practically unaltered. The slight left hemiplegia remains, but has not increased. No other affection of muscles or of sensation has shown itself. No optic papillitis. Pupils are equal and react well. The reflexes are as described on admission. There has been no nausea or vomiting.

June 8th.—Had one slight fit to-day similar to the previous ones in character. Consciousness was lost for a few minutes.

July 14th.—Had this evening a series of twelve consecutive left-sided fits. The first began at 9.5 P.M. There was no apparent aura, the man falling suddenly to the ground without a cry and rapidly becoming unconscious. Each fit lasted from six to ten minutes from first to last and was followed by an interval of from one to three minutes before the onset of the next fit. The fits were very severe and were severally alike in their characteristics, each fit resembling in its features the preceding ones. The description of the fits which occurred last February applied to the present series in every respect except that each phase of the convulsion had a longer duration than at that time. Beginning as before with a strong conjugate deviation of the head and eyes to the left, followed by an almost simultaneous stiffening of the muscles of the left side of the face, body and left arm and leg in tonic contraction, and ending in very strong jerkings of these same parts. No appreciable difference in the times of onset of the muscular contractions (tonic or clonic) in the several parts affected could be detected. The temperature rapidly and steadily rose, and at 9.30 P.M. (twenty-five minutes after the onset of the fits) had reached 104°; pulse 120; respiration 40. At 10.15 the temperature was 107°, and 109° at 10.35 P.M.; pulse 180, feeble and running; respiration 64, shallow and whiffling. Ninety grains of chloral hydrate were given in two doses—the first dose at 9.30 P.M., the second at 10 P.M. At this time he was able to swallow, although apparently quite unconscious. Whisky was also given by the mouth and by the rectum. As the temperature increased the man's condition became very serious indeed. He was quite comatose, lying supine with flaccid limbs in the intervals between the fits; the face was of a dark-red colour, becoming more and more livid and bloated as fit succeeded fit, until his face and body generally assumed the same livid dusky tint. He sweated profusely, the water rising in the form of steam in clouds from the surface of the body. He breathed rapidly, shallowly and with a whiffling sound. The pulse was very small, soft and of a running character. The pupils were widely dilated and insensible, reflexes of every kind being quite abolished.

As the chloral seemed to have no effect and the man's condition was very serious the inhalation of chloroform was commenced at 10.15 P.M. It had to be cautiously administered because of the feeble state of the patient and then intermittently. For some time it also had no effect, and it was not until 10.35 that the fits began to lessen, and from that time until 11.5 only a few abortive ones occurred. At 11.40 the temperature had fallen to 107° and at 11.35 to 104.6°. The chloroform was then stopped, and shortly afterwards there seemed to be a slight return of consciousness and of reflex action, the man becoming restless and a slight conjunctival reflex (right) was obtained. During the next few hours the restlessness became more marked, the patient tossing his head from side to side, groaning and often raising his right hand to his head. There was a marked look of pain on his face, which still wore a livid aspect. Breathing became jerky and catching.

15th.—A: 10 A.M. the temperature had fallen to 100°; pulse 120, still soft and small; respiration 56, whiffling and catching. There is complete left hemiplegia (face, arm and leg), both motor and sensory. Reflexes, superficial and deep, are absent. Pupils small, equal, and act badly. He has been restless during the night but with short sleeps; is conscious, but is dull and drowsy and can give no account of himself. Still complains of right-sided headache; has had no vomiting. Can swallow but slowly and chokily. Passes his evacuations into the bed. Has had no return of fits. 5 P.M.: The patient is becoming weaker, face is paler and is looking pinched. Temperature 99.6°; pulse 132, very feeble and running. He is breathing very quickly and shallowly, 64 to the minute, and is drowsy and sleeps at intervals, but he is often distressed by the pain in his head, which at times is very severe, causing him to groan loudly and to toss from side to side; he has not vomited; can swallow, but less readily. There is a slight return of power in the left thigh (extensors), but otherwise the paralysis of the left side is complete; no squint or apparent weakening of the eye muscles. He was ordered stimulants and liquid nourishment by mouth and rectum. No twitching of muscles or return of the convulsions.

The patient did not improve but steadily became weaker, the heart evidently failing. The pulse became imperceptible at the wrist, the extremities were cold and the face pale and pinched. Towards the last he lapsed into stupor and died quietly at 11.45 P.M.

*Post-mortem examination, thirty-nine hours after death.*—The body was well nourished and muscular. Rigor mortis was present in legs, passing off in arms and absent in neck. There were marks of old ulcers on the right calf over the lower half of the fibula; the post-mortem staining was well marked. The calvaria was fairly hard and of medium thickness, symmetrical, and showed no sign of disease or of injury. The dura mater and pia arachnoid were normal; twenty-nine drachms of translucent fluid collected; sinuses full of dark liquid blood. The brain weighed 48½ oz. There was a moderate amount of venous congestion on the surface, but this did not extend to the smallest radicles. The cortex generally appeared normal, was firm in consistence, and the convolutions were well marked except in the following parts. The right temporo-sphenoidal lobe at its upper and anterior part was small and soft, and the adjacent parts of the ascending and third frontal convolutions were also rather small and flattened. On separating these convolutions and opening up the Sylvian fissure a yellow translucent mass was seen occupying the position of the island of Reil on this (the right) side. This growth was evidently the cause of the wasting and flattening of the above-named convolutions. On further dissection the full extent of the growth was made apparent. It was of an oval shape, twenty-three lines in its antero-posterior diameter and eighteen lines in its lateral diameter. Occupying the place of the convolutions of the island of Reil it had involved the claustrum and the outer or third part of the lenticular nucleus in their entirety and nearly half of the second part of the said nucleus. The internal capsule was flattened and somewhat displaced inwards, but the growth had not involved it nor was there any apparent difference in colour and texture compared with the normal condition. The brain tissue round the tumour looked pale and somewhat yellowish. The tumour was of rather soft consistence, especially in the centre, where the softness amounted almost to diffuence. It was of a yellowish-buff colour and of gelatinous appearance. No hæmorrhages old or recent had occurred into the tumour. After hardening sections of the tumour showed it to be a soft glioma of typical appearance; fatty degeneration was beginning in the middle; no hæmatoidin

crystals were seen. Other sections were made both in the fresh state and after hardening to determine the extent of the growth. The internal capsule showed no evidence of growth and it was not until the middle of the second part of the lenticular nucleus was reached that glioma tissue was observed. No evidence of new growth was found in the frontal or temporo-sphenoidal convolutions. The lateral ventricles were normal. No other lesion of the brain or of the spinal cord was observed. All the organs were soft and dark in colour, probably from the pyrexia. With the exception of small hæmorrhages into the lower lobes of both lungs there was no evidence of disease in any of the thoracic or abdominal organs.

## Medical Societies.

### PATHOLOGICAL SOCIETY OF LONDON.

*Lingual Ulcer.—Infantile Adrenal Disease.—Papilloma of Penis.—Hæmorrhage into Pericardium.—Renal Sarcoma spreading down Ureter.—Psorospermosis and Squamous Epithelioma.—Ulceration of Arm following Vaccination in Hereditary Syphilis.*

AN ordinary meeting of this Society was held on Dec. 20th, the President, Sir George Humphry, in the chair.

Mr. WINGRAVE showed a patient aged fifty with a sharply defined ulcer on the tip of his tongue of about the size of a shilling and heart-shaped, with the apex extending towards the frænum. The base consisted of florid raspberry-like granulations, projecting through a creamy discharge, whilst the edge was of a vivid red and rather elevated. The surrounding tissue was but slightly indurated. Beyond a little soreness during eating there was no pain. The submaxillary glands were scarcely felt. It commenced ten months ago as a small red pimple, which he attributed to smoking clay pipes. There was no specific history. His father died of "blood-spitting," but beyond this there were no family indications of tubercle. He had never been seriously ill excepting two years ago, when he spat up blood for several weeks on and off. Had smoked and indulged in alcohol freely. Had lately lost flesh and been troubled with night sweats and bronchitis, with profuse expectoration. During the last few weeks diarrhœa had reduced his strength considerably. Beyond some bronchial râles no definite physical signs were to be made out. His dentition was somewhat remarkable, the canines being represented by very prominent "tusks," whilst his other teeth were in various states of decay. The canines were filed down and all rough edges were removed so that for at least four months dental irritation might be excluded. Superficial scrapings were examined for tubercle bacilli with negative results. The case had a strong resemblance to two examples of lingual ulcer reported by Mr. Morton on Jan. 5th last, but in these there was abundant evidence of tuberculous changes elsewhere. The general features and the sites of the ulcers were similar, whilst the age in one was fifty-five and the other thirty-four.

Mr. WAINWRIGHT showed the Adrenals removed from an infant that was admitted to hospital with purulent ophthalmia. At the post-mortem examination these organs were found extensively diseased. They were half an inch long and five-eighths of an inch across, being tough and slightly nodulated. The outer layer was white and apparently normal. Inside this there was a band of yellow pigment, and the central portion was translucent and gave a sensation of grittiness to the knife. Under the microscope the internal portion was proved to consist of a fibrous network containing many small cells in its meshes and also much caseous and calcareous matter. There was nothing resembling a tubercular area or giant cells.—Dr. WHEATON considered that the lesions were the result of an antecedent hæmorrhage.

Mr. W. ARBUTHNOT LANE read the report of a case of very extensive rapidly destructive Papilloma of the Penis which had been under his care. It occurred in a man aged thirty-nine, who had never before suffered from any venereal complaint. Three weeks after connexion with a prostitute he found the prepuce swollen, and he was seen by a medical man, who stated that he found a ragged chancre on the under surface of the prepuce. This became phagedenic, and was treated by nitric acid &c. The organ, in spite of

this treatment, continued to enlarge, and he was admitted into Guy's Hospital about four months after the onset of his symptoms. On admission the penis was represented by a large soft globular mass as big as an orange and consisting of a soft finely branching papillomatous material, which bled readily both spontaneously and on being manipulated. This extended to the root of the penis, where it ceased abruptly, and forwards around the margin of the glans. Warty material was observed in the orifice of the meatus, but this was not continuous with the papillomatous growth around the corona. No trace of any ulceration of a phagedænic character or otherwise could be seen. On attempting to shave off the warty mass it was seen to penetrate the corpora cavernosa to some extent and to have destroyed the floor of the penile urethra, along which the growth extended forwards to the anterior orifice and backwards nearly to the limit of the outside growth. The penis was therefore amputated and its subsequent examination appeared to show that the papillomatous growth started in the urethra at a distance of about three-quarters of an inch from the orifice, that it perforated the spongiosum and skin of the foreskin, when it simulated a chancre, which soon developed an apparent phagedænic appearance, and that the soft papillomatous growth rapidly extended backwards and forwards over the penis, destroying the skin and the surface of the cavernosa. It was papillomatous in structure, presenting no evidence of epithelial ingrowth. The patient recovered without any recurrence and was now quite well.—Mr. SHATTOCK referred to a specimen in St. Thomas's Hospital, which was much like the one shown and which, while it resembled in structure a papilloma, yet infiltrated the neighbouring tissues.—Dr. WILKINSON thought that the formation was much like those structures which grow in the bladder resembling papilloma, but being really of carcinomatous nature. The specimen was referred to the Morbid Growths Committee.

Dr. ROLLESTON showed the Heart and Aorta of a man who fell dead off his cab and was brought into St. George's Hospital. There was a rupture of the internal and middle coats of the aorta a quarter of an inch above the aortic valves. The rupture ran upwards for an inch and a half and was on the right side of the aorta. The external coat and visceral layer of the pericardium were intact, except for a small perforation about the size of a pin's head. It was bulged out and very thin. The aorta was generally atheromatous and the first part of the arch was slightly dilated. The veins of the neck were distended with blood. The pericardium was distended with twenty-four ounces of recent jelly-like blood clot in addition to some blood-stained fluid; there was no pericarditis. There was a little recent clot adherent to the outside of the bulging formed by the external coat of the artery at the site of rupture. It appeared probable from the large amount found in the pericardium that the blood had filtered in gradually.

Dr. PENROSE showed the Urinary Organs from a case that had been in St. George's Hospital under the care of Mr. Bennett in the early part of 1888. The whole of the left kidney had been replaced by a large round-celled sarcoma, which weighed six pounds two ounces. The right was much enlarged and dilated. The bladder was also enlarged, and contained two masses of sarcoma cells, one of which was attached to and appeared to be growing from the neck of the bladder, but the other was lying loose within the cavity of the bladder. Both these masses consisted almost entirely of large sarcoma cells, identical with those of which the kidney growth was composed. From the clinical history of the case it was gathered that the patient had been losing flesh for about two years before death; that early in December, 1887, the urine became difficult to pass, as the stream would stop suddenly, and only after a considerable interval of time would dribble away. On Jan. 23rd, 1888, after having strained hard to pass urine, during which the patient was in great agony, he found a long worm-like body issuing from the urethral meatus, and about a quarter of an hour later this mass was shot out of the urethra. It was examined by Dr. Delépine, who reported as follows: "This cast is partly composed of coagulated blood and partly of tumour cells. The tumour cells form masses distributed all through the cast; from their nature the tumour is evidently much degenerated, and it is difficult to say whether the stroma between them is not partly due to coagulated blood. It is difficult to say whether the tumour is carcinomatous or sarcomatous; it is probably sarcomatous." Whilst the patient was in hospital the urine was generally clear, acid, of low specific gravity, and with a trace of albumen; occasionally, however, it contained some small

round masses which were found by Dr. Delépine to consist of red blood corpuscles, mucus and large oval and round cells in an advanced stage of fatty degeneration. After consultation it was determined not to operate. The patient died on April 11th, 1888. At the post-mortem examination, besides the condition of the urinary organs mentioned above, secondary growths were found in the retro-peritoneal glands and in the right lung; otherwise the organs of the body appeared to be healthy. Unfortunately the brain and eyes were not examined. Dr. Penrose expressed his indebtedness to Mr. Bennett, Dr. Delépine and Mr. Bull for allowing him to bring forward the case and use their notes.—Mr. SHATTOCK referred to a specimen in St. Thomas's Hospital in which sarcoma of the kidney was associated with a cyst of the ureter.—Mr. SHIELD questioned whether the lower growth was not one which had become implanted from the upper.—Dr. CHARLEWOOD TURNER referred to a specimen which he showed some years ago. It was an instance of cirrhosis of the liver and the blood in the larger branches of the portal vein was found to contain liver cells. This was believed to be due to rupture within the organ, the cells becoming detached and washed into the blood current.—Mr. BIDWELL, after examining a kidney recently removed for sarcoma, found the ureter much dilated and an easily detachable fungating growth extending down it.—Dr. ROLLESTON regarded implantation as improbable and believed that the growth was an extension down the ureter which had contracted adhesions at a lower point.—Mr. SHIELD maintained that the known fact of secondary growths arising from portions of the original neoplasm carried by the veins was in favour of the implantation view.—Dr. PENROSE replied that he regarded the lower growth as an implantation one and similar to that at the neck of the bladder. There was a mass of sarcomatous cells lying free in the bladder which was covered with phosphatic deposit.

Mr. J. JACKSON CLARKE described a case of Epithelioma of the Septum of the Nose. The growth was removed from a gentleman aged eighty-two by Dr. Scanes Spicer, and was a squamous epithelioma abounding with what must be regarded as psorosperms. Before making the report the sections were compared with those of a case of psorospermiosis of the kidney, ureter and bladder previously described. At the time he brought the specimens from that case before the Society he had been unable to prove conclusively that the lesions were of psorospermial origin. This was on account of the absence of coccidia with special capsules resisting staining fluids like those of the rabbit's liver and of the resemblance of the large cells in the cysts of the kidney and ureter to the so-called "colloid cells" of squamous epithelioma. But he had since fully convinced himself that that case was one of psorospermiosis. A further examination of the lesions showed those of the ureter and bladder to be of the type of cystic adenomata. On comparing the psorosperms of the renal and ureteral cysts with certain cells of the squamous epithelioma he found an exact correspondence of structure and concluded that the epithelioma was also of psorospermial origin. The chief points of resemblance were enumerated as follows:—1. In neither case were coccidia with special stain-resisting capsules discovered, but every other stage of the rabbit's coccidia was represented in both cases. 2. In sections of the tissues hardened in Müller's fluid large cells, chiefly oval in shape, staining deeply with carmine and but slightly with acid hæmatoxylin, were present. In the epithelioma the form of some of the cells was greatly modified by pressure of the surrounding cells. In epithelioma these cells, which had hitherto been regarded as degenerated epithelial cells, were unmistakably psorosperms. The idea of degeneration was in both cases absolutely negatived by the beautiful nuclear figures presented by some of the peculiar cells and by clear evidences of the biological processes described below. 3. The large cells at a certain period of their existence showed an extension of the nuclear network which eventually filled the whole cell and this then divided into a great number of amœbæ which were set free by rupture of the capsule of the mother cell, if it had not disappeared already. Conjugation previously to the amœba formation was observed. 4. In both cases there were many large psorosperms lying within epithelial cells, the parts of which adjoining the parasites were modified into capsules. In sections stained with micro-carmine and mounted in glycerine these capsules were seen to possess a beautiful radial striation, which sometimes gave a semblance of a radiated structure to the protoplasm of the psorosperm, a semblance which on close examination disappeared. Mr. Clarke had not seen any clear account of the amœboid stage of

psorosperms in cancer. Most writers had failed to distinguish the amoebæ from leucocytes. He stated that this stage of the parasite's cyclic existence afforded the key to the malignant character of the disease. He had detected clear evidence of the following process:—1. A single psorosperm or one resulting from the conjugation of two or more became changed by the formation of a usually delicate but sometimes coarse reticulum which extended outwards from the nucleus or nuclei till it filled the whole cell. 2. The reticular plasmodium usually surrounded by the capsule, consisting of the dead and distended host-cell broke up into rounded segments which kept the reticular structure and stained slightly purple with acid hæmatoxylin. 3. Within some of these daughter psorosperms fine filaments of chromatin appeared, whilst the reticular structure became less obvious in the rest of the cell. The amoeboid cells were set free by rupture of the capsule (when present). They give evidences of multiplying by division and were easily distinguished from leucocytes in specimens treated with acid hæmatoxylin. 4. The amoeboid parasites made their way in vast numbers into the connective-tissue spaces beyond the epithelial part of the growth. In their passage they caused separation of columns of epithelial cells and thus brought about a multiplication of the points of epithelial ingrowth and detachment of small groups of epithelial cells. A considerable amount of inflammation was caused by the invasion of the vascular tissues by the amoebæ, with the same result as was seen in inflammatory papillomata—e.g., mucous tubercles—namely, an extension of epithelial growth and a formation of new bloodvessels &c. 5. Most of the amoebæ disappeared and the inflammation subsided. A small proportion of the parasites entered epithelial cells, where, even in the non-nucleated amoeboid stage, they could with care be detected. In the course of growth they remained near the central parts of the epithelial columns, as the now familiar intra-cellular psorosperms which in squamous epithelioma were most abundant in and about the cell nests. When they arrived at a certain stage the cycle was renewed and a fresh extension of growth, sometimes with separation of lymphatic or venous epithelial emboli, and resulting metastasis. In conclusion, he insisted that the cyclic life of the parasites and their reaction on the tissues of the host accounted for all the phenomena of the disease. The contents of the cysts in the case of psorospermiosis of the urinary tract resembled to the naked eye those of the cysts of colloid cancer. A consideration of the case afforded suggestions for the investigation of mammary adenomata, adenoma of the cervix uteri &c. in their relation to cancer. The amoeboid psorosperms were identical in structure with some of the plasmodia met with in ague. The cyclic course of this disease was suggestive of a cycle in the life of the parasites. There might be psorosperms in the enlarged spleen and in lymphadenoma from which it was but a step to leucocythæmia and sarcoma. In the squamous epithelioma of the septum of the nose and in one of the lip, two of the tongue, in a cancer of the kidney and several of the breast he had found the structural evidence so full and complete both in the primary and in the secondary growths, that in these cases he deliberately attributed the disease to the parasites. In a cystic scirrhus removed by Mr. Edmund Owen from a woman aged twenty-eight the cream-like contents of the cysts consisted wholly of amoeboid psorosperms. The paths of the infection remained to be explored; apart from this the mystery of the disease was solved.—Mr. SHATTOCK said that, with Mr. Ballance, he had been studying this subject for a long time. Until the organism was successfully cultivated and Koch's four postulates were fulfilled it was not right to affirm that these organisms were the cause of cancer, though that view might seem exceedingly probable. These appearances had mostly been found in squamous epithelioma, but there were many objections to examining surface growths, as the vagina, for instance, normally contained protozoa, and growths from the uterus might be influenced by their presence. Though Mr. Clarke might have demonstrated one cycle of the growth of the parasite, it was quite possible that there was another cycle outside the human organism—in rabbits, for instance, appearances were often found different to those described. He himself inclined to Metchnikoff's view that the parasite did not grow within the body or within the tumour. They could not infect lower animals with cancer from the human being, but they were endeavouring now to discover how to cultivate the parasite outside the body and then infect the lower animals with it. Though there had been a few cases of successful inoculation, these were as rare as the occurrence of cysticerous in man.—

Dr. GALLOWAY found that Mr. Clarke's description did not agree with that of other observers and held that it required much courage to say it was the psorosperm at all. He agreed that squamous epithelioma was a most misleading growth to study and said that the material to be examined should be removed with much care and immediately placed in hardening fluid.—Mr. CLARKE replied that he had not confined his study to squamous growths and he maintained that there was evidence in the sections he had shown of the biological processes he had described. The cycle he had described as taking place within the body he believed to be the most important if not the only one so far as the patient was concerned. He had adopted every precaution in preserving the tissues before examination.

Dr. WHEATON showed a specimen of Ulceration of the Arm following Vaccination in a case of Hereditary Syphilis. The child was born in an infirmary, and was vaccinated when seven days old. It was well nourished at the time of birth, but the mother stated that it had "snuffles" from the first. No result followed vaccination until the seventh day, when large white blisters appeared at the points of inoculation. Seven days later the blisters burst, leaving three deep ulcers in the skin. Simultaneously with the bursting of the blisters similar ones appeared on the abdomen. The ulcers on the arm continued to enlarge and two of them coalesced, so that there were two circular ulcers on the arm, each larger than half a crown, when the child was admitted into hospital, six weeks after vaccination. On admission there was also a general pemphigoid eruption with desquamation of the cuticle of the hands and feet, fissures of the mouth and dark-brown stains on various parts of the body. Mercury was at once given and the ulceration of the arm improved rapidly; when the child died four days later one ulcer had nearly healed and the other had become covered with a thick scab. Dr. Wheaton said that the case was clearly one of phagedenic ulceration; following vaccination in a child suffering from hereditary disease, and in which the vaccination had hurried on the development of the cutaneous eruptions of hereditary syphilis. In cases where primary inoculation had occurred by vaccination the secondary eruption never appeared in less than nine weeks afterwards, whereas in the present case it had developed in fourteen days. The presence of hereditary syphilis was a frequent cause of phagedenic ulceration in infants. Any lesion of the skin, such as vaccination, impetigo or the separation of the umbilical cord, might be followed by this ulceration; and he had seen it occur on the soft palate, accompanying tonsillitis in a syphilitic infant. It was impossible to avoid vaccinating infants who might appear to be quite healthy but were the subjects of hereditary syphilis, and the earlier the vaccination was performed the greater the risk, as in the case described.—Mr. SHIRLEY MURPHY had found that similar effects followed the use of calf lymph in children suffering from hereditary syphilis, and that the syphilitic eruption generally appeared on the tenth day after vaccination, which coincided with the time of the appearance of the eruption in inoculated small-pox and also with that of the appearance of erythematous rashes after vaccination.

The following card specimen was shown: Ivory Exostosis of the Skull.

## Reviews and Notices of Books.

*Dissections Illustrated: a Graphic Handbook for Students of Human Anatomy.* By C. GORDON BRODIE, F.R.C.S., Senior Demonstrator of Anatomy, Middlesex Hospital Medical School, Assistant Surgeon to North-West London Hospital. Part I., The Upper Limb. London and New York: Whittaker & Co. 1892.

THE first part of this handbook, which will be completed in four parts, contains seventeen coloured plates, two-thirds of the actual size drawn and lithographed by Mr. Percy Highley. The plates are exceedingly well drawn and placed on stone, and when we add that in many respects they are nearly as good as the well-known masterpieces of Professor Ellis and Mr. Ford we are giving them high praise. By reducing the size and the expense it is hoped that students will use such plates as models for their own dissections and we may say that if so

used much benefit will be derived from the study of them. We venture to think that the diminution from the life-size will prevent the plates from being too greatly used by the student to "recall the work already done when revising his anatomy previous to an examination." This revision can only be thoroughly done by direct study from the subject itself. The plates seem to be quite correct and to have been taken from actual dissections, and some good illustrative diagrams are added. The explanatory letterpress is clear and concise, but mainly morphological and not such as can be understood by the junior student. But apart from this we can strongly recommend the work as a legitimate aid in the dissecting-room. The cost of this part is 8s. 6d., which is certainly remarkably small when the accuracy and finish of the illustrations are taken into consideration.

*Alcoholism and its Treatment.* By J. E. USHER, M.D., formerly Surgeon Superintendent and Medical Officer of Health to the Queensland Government. London: Baillière, Tindall & Cox. 1892.

THIS little work of 148 pages contains some interesting studies in alcoholism from a cosmopolitan standpoint and differs very much from the scholastic essays on this subject with which we in this country are so familiar. The conclusions of the author as to the causation of chronic alcoholism are thus expressed:—"Heredity in 60 per cent. of cases; injuries, railway shock and wasting diseases, 20 per cent.; nervous exhaustion, 10 per cent.; whilst 5 per cent. of the remainder can be laid to insanitary conditions and poor food." We cannot but think that the former cause will be found to coexist with many of the latter if a severe investigation were made. The chapters on insanity and alcoholism, alcoholic trance and crime and cerebral automatism or trance, are very interesting. The cases would have appealed more strongly to English readers had they occurred in this country. Extreme forms of religious devotion, extreme examples of neurotic diseases and extreme cases of alcoholic inebriety and narcotic poisoning, and we may add a use of powerful physiological drugs for the cure of the latter conditions, seem to be much more common in America than in this country. The laws of England and America differ very much as to the mode in which sufferers from alcoholism should be dealt with, and a concise review of the drunkard's legal relations in America and in England, both in civil and in criminal cases, is one of the best features of the book. The only efficient treatment of confirmed alcoholism consists in isolation, proper supervision and the prevention of the obtaining of alcoholic stimulants or narcotics under any pretext; for the adjuvants used by many and various well-known authorities on alcoholism we must refer the reader to the later chapters of the work itself.

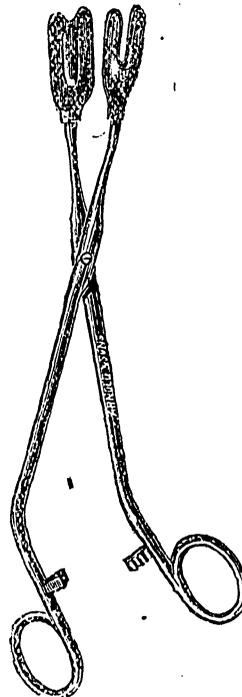

**THE CORBETT HOSPITAL, STOURBRIDGE.**—The gentleman (Mr. John Corbett of Impney) to whose liberality the existence of this institution is owing, as well as many other gifts in the way of enhancing its value to the poor of the neighbourhood, has forwarded a further cheque of £500 to the committee in order to supplement any deficiency which may be found to exist in the amount required for furnishing the institution.

**METROPOLITAN ASYLUMS BOARD.**—The number of patients remaining in the several hospitals of the Board at midnight on Dec. 27th was as follows:—Eastern Hospital, 305 scarlet fever, 59 diphtheria and 38 enteric fever; North-Eastern Hospital, 407 scarlet fever; North-Western Hospital, 316 scarlet fever, 93 diphtheria and 13 enteric fever; Western Hospital, 285 scarlet fever, 32 diphtheria and 13 enteric fever; South-Western Hospital, 271 scarlet fever, 54 diphtheria and 19 enteric fever; South-Eastern Hospital, 327 scarlet fever, 17 diphtheria and 15 enteric fever; Northern Hospital, 755 scarlet fever and 6 diphtheria; Gore Farm Hospital, 620 scarlet fever. On the hospital ship *Atlas* on the same date there were 39 cases of small-pox and at the South-Eastern Hospital there was one case.

## New Inventions.

### TONGUE FORCEPS.

HAVING frequently felt the want of a reliable and efficient

tongue forceps when performing operations on the mouth and naso-pharynx, and having invariably met with disappointment when using any of the numerous instruments supplied for this purpose, I have designed an instrument which I can with confidence recommend to my professional brethren. It has been manufactured for me by Messrs. Arnold and Sons with their usual care and has thoroughly answered my requirements. The blades are somewhat quadrilateral with rounded handles, fenestrated and made of slightly flexible steel, with the surfaces for contact roughened; the lower blade has a U-shaped notch for receiving the frænum linguæ. The blades are covered with rubber to prevent injury to the mucous surface. The handles are long, provided with a catch and bent at an angle, so that they can be held without interfering with the view of the operator. These forceps will retain an efficient hold without inflicting injury on

the organ, and will be found as valuable for drawing forward the tongue during anaesthesia as for operative purposes.

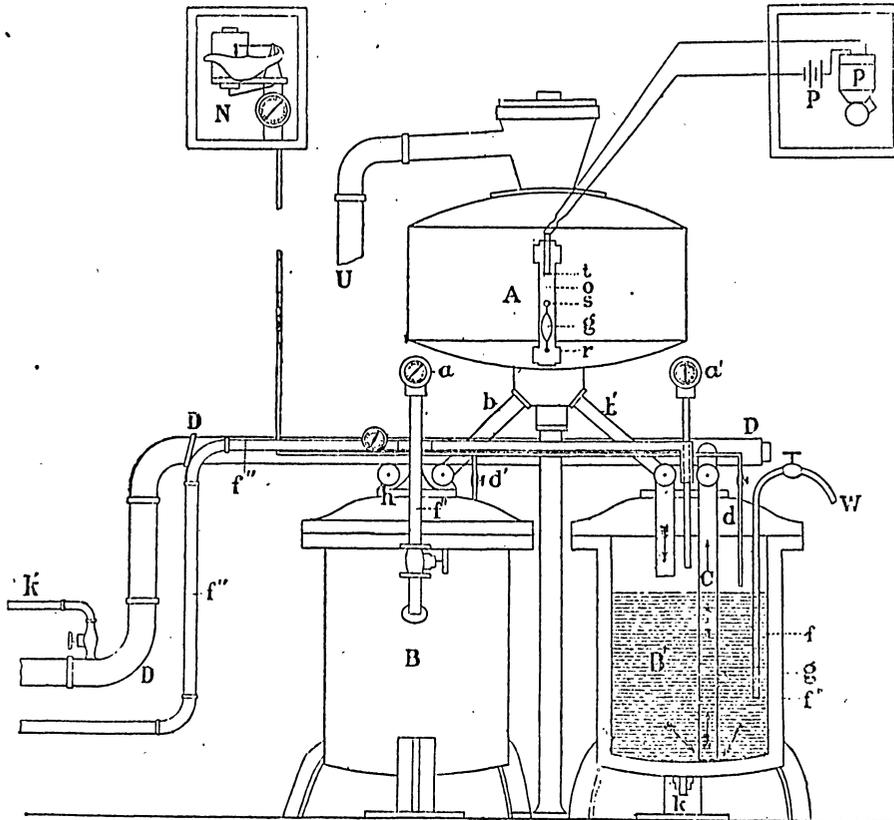

C. YELVERTON PEARSON, F.R.C.S. Eng.,  
Assistant Surgeon to the North Charitable Infirmary and  
City of Cork Hospital &c.

### APPARATUS FOR THE DISINFECTATION OF FLUIDS.

MANY readers of THE LANCET have lately been interested in reading of Professor von Pettenkofer's dietetic feat in eating Koch's cholera microbes. It must, however, be admitted by everyone that the whole incident proved nothing, except that Koch's bacilli disagreed with von Pettenkofer. It is not uninteresting to note that the number of THE LANCET which contained this record contained also a careful account by Dr. Clemow of Cronstadt of the methods adopted in Russia for the disinfection of cholera evacuations. Amongst other methods he mentions that of boiling, which process is carried out at the Alexander (Barrack) Hospital at St. Petersburg. The apparatus is somewhat complicated and a description of it may be of interest. The receptacle A, holding about eighteen gallons, is joined by means of tubes, *b* and *b'*, with the two boilers B and B', having double walls *f* and *f'*, capable of supporting a pressure up to seven atmospheres. The pipes *b* and *b'* open within the boilers in such a manner that the end of each stands out a little from under the lid of the boiler. Into each of the boilers is led another tube, *c*, going almost to the bottom, which unites with the tube *d* for the purpose of passing the contents of the boilers into the drain. Each boiler is provided with a manometer *a* and *a'*, showing the pressure within the boilers. The steam from the general steam boiler is led by the tube *f'* into the interval, *g*, between the walls of the boilers, and having done its work has exit through the tube *h* into condensing vessels. At the stopcocks of the tubes *b* and *b'* and also of the tube *c* is an adjustment, *h*, allowing

the stopcocks of the entrance to open when the stopcock on the exit tube is closed and *vice versa*. The tube *w* serves for receiving samples of the contents of the boilers for examination. For control of the work from the boilers *B* and *B'* are the tubes *d* and *d'* go to the manometer *N*, which has a clock-work mechanism and a recording apparatus which marks the pressure in the boilers and, how long the pressure has lasted. This control apparatus is situated in the private room of the doctor who has charge of the disinfecting processes. For control of the fluids entering the receptacle *A* and to avoid its

boilers into the drainage-pipe by the tube *D*, cold water being previously admitted into this last through the tube *N'*, for mixing with and cooling the disinfected fluid. The whole process, counting from the moment of filling the boilers and entrance of steam till the exit of fluid into the drain, takes about an hour, during which the pressure as shown by the manometers attains that of three atmospheres, with a pressure of four atmospheres in the great general steam-boiler. This time is shorter if the boilers work constantly—i.e., their walls being warmed by the previous boiling are not cooled by the new portion of fluid entering them. This apparatus was

being overfilled in a gauging-tube, *o*, is placed a glass float, *g*, with a reservoir of mercury at the lower end, and a little cup, *s*, at the top, which is also filled with mercury. Through the upper opening of the gauging-tube are admitted into its canal two platinum wires, *z*, of equal length, the lower ends of which can be fixed at any given height, corresponding to the level of a known quantity of gallons of fluid in the receptacle *A*. The upper ends of these wires are united with elements (Laclanché), *p*, and with a bell, *r*, placed in the building of the general boilers of the hospital, and therefore near to the firemen and machinists. Fluids from the post-mortem room flow through tube *U* into *A*, the level of the post-mortem room being higher than that of the receptacle *A*. The whole process of disinfection is carried out thus:—From the receptacle *A* the fluid flows through the tubes *b* and *b'* into the boilers *B* and *B'*. Into the now empty receptacle fresh quantities of fluid are introduced while that is being disinfected in both boilers, so that the one process does not prevent the other. When the boilers are filled steam is admitted through the tube *f'* into the interval *g* between the walls of the boilers. The degree to which the fluid is heated is shown by the manometers acting on the recording apparatus *N*. When the process is finished the stopcocks of the tubes *c* open and let out the contents of the

invented by MM. Vassilief and Krel, and the diagram is taken from Dr. Krupin's book. I have to thank this gentleman for his permission to reproduce it and Dr. Clemow for kindly translating the accompanying description.

RICHARD SISLEY.

**THE ALBERT PALACE.**—The promise of £15,000 made to Mr. John Burns, M.P., by Mr. Passmore Edwards seems likely to result in the acquisition by the public of this important place of instruction and recreation as soon as the necessary preliminaries are carried out with the First Commissioner of Works.

**LONDON AND COUNTIES PROTECTION SOCIETY.**—A meeting of the Council of the East Anglian Division of this Society was held at Hatter-street, Bury St. Edmunds, on Wednesday, Dec. 21st., Mr. Fegen of Braudon presiding. After some general business had been transacted, it was decided to hold a general meeting of the members and others interested in medical protection at Bury, at an early period in 1893. John Kilner, Esq., F.R.C.S., senior surgeon to the West Suffolk Hospital, being invited to preside. Mr. Mead (Newmarket), the organising secretary, reported that at least thirty divisions had been already formed and that at a recent meeting of the General Council in London 142 new members were elected.

# THE LANCET.

LONDON: SATURDAY, DECEMBER 31, 1892.

## THE ANNUS MEDICUS 1892.

THE year 1892, viewed from a medical standpoint, has been an eventful rather than a happy one. It was not many days old before a recrudescence of influenza manifested itself in this and other countries, and that in a more fatal form than on previous occasions. One of its earliest and most distinguished victims was our illustrious ally the KINGEDIVE; pneumonia ensued and put a speedy termination to the life of his Royal Highness, under circumstances fully detailed in THE LANCET of Jan. 23rd. The death of the Duke of CLARENCE from pneumonia on Jan. 14th, on the very eve of his marriage to the Princess MAY, was an event which sensibly affected the whole nation, and even other nations, as was natural from considerations of the lofty rank and anticipated future of the illustrious pair and the affection in which the Royal Family is held at home and abroad. We shall have to tell later of the wide mischief wrought throughout this country and other lands by this epidemic and of another one still more "feared of man," but which yet does not move more mysteriously and uncontrollably, and from which we happily have been so far spared in spite of occasional cases landed on our open shores.

The public spirits, to speak colloquially, have been lowered throughout the year by the prevalence of depressed conditions of trade and by a movement which it should be the object of legislators to counteract—that of the rural population into towns, depriving them of the advantages of country life while complicating and injuring in many ways the case of dwellers in towns. It is not seemly for us to indulge in reflections on political affairs save as they affect the health and wellbeing of nations, but we may be permitted to make note of the fact as one unprecedented in history that Mr. GLADSTONE at the ripe age of eighty-three has again become Premier and that he has taken into his Ministry a member of our own profession—Sir WALTER FOSTER. Whatever the politics of medical men they will not fail to see in this act of Mr. GLADSTONE a certain recognition of a profession, for which our statesmen have done less and to which they have shown less respect than the statesmen of any other country of Europe. It is undeniable that the profession has great lessons to teach States, and that our own country in particular has been served as well as, if not better than, any other by its medical men either in practice or in medical relation to the Government. But so far they have been lightly regarded as compared with other professions, and one great branch of the Legislature, the House of Lords, is conspicuous by the determined exclusion from it of medical men, no matter to what eminence they may have attained. In respect of France, on the contrary, columns of *The Times* are filled with a report of the proceedings in honour of M. PASTEUR on his attaining to his seventieth birthday, graced by the presence of the PRESIDENT of the Republic and led by M. DUPUX, Minister of Public Instruction. We shall at once proceed, under definite heads, to indicate the chief facts in the medical history of the year 1892.

### *Anatomy and Physiology.*

The large and constantly increasing number of journals devoted to the subjects of anatomy and physiology, together with the length, variety and excellence of the papers they contain, render it year by year a more difficult task to supply a concise summary of the work that has been accomplished in these departments of medicine and still less to give any critical estimate of its relative value. Long articles are not always the best, even when names of high repute are appended to them, whilst an unknown and rising man may in a few lines shadow forth a substantial addition to our common stock of knowledge. Perhaps the most interesting of the memoirs that have recently seen the light are those on the nervous system. No one who first attempts to unravel the various plexuses of nerves that exist in the thorax and abdomen would conceive that by any human means the origin, course and distribution of their constituent fibres could be traced, so complex and intricate is the interlacement they present. To effect the dissection by hand with the naked eye is impossible, but even the microscope with its various accessory means of staining and mounting seems at first sight to afford little aid to the inquirer. But care, close observation and patience overcome many obstacles and the researches of GASKELL, SHERRINGTON, RUSSELL, EDGEWORTH and LUCIANI show that the scheme of the arrangement of these complex networks is beginning to yield to the attack and that it may be hereafter possible to understand the composition and the function of each separate strand. This result proceeds mainly from the original observation of GASKELL, that the splanchnics and other visceral nerves, instead of consisting exclusively, or almost exclusively, of sympathetic fibres, really contain three or four quite distinct sets of fibres, distinct in their origin and distribution, probably possessing distinct attributes and powers, and presenting sufficient difference in their aspect to enable them to be followed. From EDGEWORTH'S observations, for example, it appears that the pelvic viscera have a double supply of large medullated fibres, one coming directly from the sacral nerves, the other indirectly through the hypogastric from the lower dorsal and upper lumbar nerves, and by making a series of continuous sections upwards from the ramus communicans it was found possible to trace up these large fibres into the posterior root of the nerve, affording strong evidence of the sensory function of these large medullated fibres, a view that is fully sustained by the results of degeneration on cutting the posterior root proximally and distally to the ganglion and from the results of its stimulation, and still further sustained by examination of the fibres proceeding to the Pacinian corpuscles in the mesentery of cats. From such converging and mutually corroborative evidence it is clear that the large medullated fibres found in the sympathetic, and probably also those in the sacral splanchnics, are sensory in function. So, again, the observations of RUSSELL and SHERRINGTON have demonstrated that great uniformity underlies the apparent complexity of the brachial and lumbo-sacral plexuses, that the several roots have a very definite and constant distribution, that the fibres representing or capable of exciting certain movements always preserve the same position in a given root; so that, for example, extension of the wrist is effected by a fasciculus of fibres in the upper part, whilst flexion is re-

sented by a bundle in the lower part of the same root, and that a great number of muscles obtain their nerve supply from several nerve roots; so that whilst their synergic action in the various coördinated movements of the body is provided for, injury or disease of a particular root is followed by only a partial and temporary loss of function. SHERRINGTON has been able to give a long and interesting list of the muscles that can be called into action by the stimulation of each special nerve root. It cannot be doubted that such researches will prove of the utmost value in diagnosis and treatment, and it is difficult to see how such knowledge can be obtained without the aid of experiments on animals rendered insensible by chloroform.

The difficult subject of taste sensations has been investigated by L. E. SHORE of Cambridge, whose experiments were based on the remarkable action of a plant named *Gymnema sylvestre*, belonging to the Asclepiadææ, the leaves of which contain about 6 per cent. of a substance resembling chrysophanic acid, which paralyses the sense of taste for sweets and bitters, but has no action on the gustatory perception of acids and salts. His observations show further that gymnema does not affect the tactile acuteness of the tongue or the perception of electrical shocks, and he has come to the conclusion that acids and salines in solutions of moderate strength excite two sets of nerves—one of general sensation and pain and the other of true gustatory function. In connexion with this subject ÖHRWALL has taken much trouble in examining the gustatory sensations excited in 125 fungiform papillæ, and has found that 21 per cent. are not sensitive at all, whilst 48 per cent. are sensitive to sweet, bitter and acid tastes. Some are sensitive to only two and a few to sweet only or to acid only, but no papilla was found which was sensitive to bitter only. In one of those exceptional cases, from which so much may be learned, the process of digestion in the stomach and small intestine was followed out by MACFADYEN, NENOKI and SIBBER. The patient was the subject of a hernia and after the operation had an artificial anus, the opening being at the ileo-cæcal valve. The duration of the passage of food from the mouth to this spot was found to be two hours at the earliest and the food of one meal continued to pass for from nine to fourteen hours. The food consisted of bread, meat, peptones, oatmeal, milk, eggs, sugar and beef-tea. The chyme as obtained from the end of the small intestine contained dissolved coagulable albumen, mucin, peptones, dextrin, sugar, inactive fermentescible and optically active paralactic acid, volatile fatty acids, especially acetic acid, the biliary acids and bilirubin. The acid reaction of the chyme was always due to the presence of organic acids. Neither indol, skatol, phenol, leucin, nor tyrosin was present, showing that in this case at least the albumen was scarcely touched by microbes in the small intestine, whilst the carbo-hydrates were decomposed with formation of acids.

Considering the prevalence of the habit of smoking and the enormous quantity of tobacco that is consumed comparatively few observations have been made from which its influence on the nervous system can be deduced. It is known to be injurious in various ways when taken in excess, but the effects of moderate smoking have attracted comparatively little attention. Some interesting facts have,

however, recently been recorded by LOMBARD. He has shown that the effect of even one cigar of moderate strength is to reduce the nervo-muscular energy to one-fifth of its previous amount. The depression is of course only temporary, but complete recovery of the former strength does not occur until more than an hour has elapsed. The loss of power was determined by ascertaining what weight could be raised in a given time by the flexion of one finger to a cord passing over a pulley to which a weight was attached. On this ground alone it is advisable that boys should not be encouraged at too early a period to commence the use of tobacco. The action of nicotine on the third nerve and ciliary ganglion has been carefully studied by LANGLEY and ANDERSON.

Many isolated physiological facts have been noted, which it is difficult to arrange in any definite order. Thus BAYLISS and STARLING have demonstrated that there is no essential difference between the hearts of mammals and cold-blooded animals and that each is subject to the same varieties of nerve influence. KAUFFMANN, experimenting on the masseter and levator labii superioris muscles, finds that the quantity of blood traversing a physiologically active muscle is enormously increased, in some instances being as much as fivefold the ordinary quantity at rest. The capillaries become greatly enlarged, the tension in the arteries falls, whilst it rises in the veins. A new form of sugar has been found by SALKOWSKI in the urine of a patient taking morphia in excess. It precipitates copper oxide from an alkaline solution of the sulphate slowly but abundantly; it does not ferment nor does it polarise light. It may be identical with the sugar excreted after the ingestion of arabinose and xylose observed by EBSTEIN. KÜLZ has proved that glycogen can be formed from various proteids. In view of the predisposition of tubercle for the apices of the lungs MELTZER of New York has endeavoured to ascertain whether in normal breathing all parts of the lungs share equally in the respiratory act, and has come to the conclusion that probably the apices and back part of the upper third of the lungs do not participate in the breathing so largely as the other parts of the lungs. The pale aspect of Europeans in the tropics has often been a subject of comment and EIJKMANN has demonstrated that this is not due to any diminution in the globular richness of the blood or of the amount of acid hæmoglobin contained in the red corpuscles, but probably to congestion of the vessels of the abdominal viscera. DAREMBERG, experimenting with dogs, cattle, rabbits, pigeons, tortoises and frogs, finds that while the serum of the blood has little or no effect on the corpuscles of the blood of the same species it dissolves those of other species and genera which, if true of the plasma also, is of importance in transfusion. TIGERSTEDT gives a much lower estimate than is usually accepted in regard to the amount of blood propelled into the aorta at each systole, calculating it on various grounds to be less than two ounces. He finds the duration of one entire circuit to be one minute. AHLFELD states that rhythmic movements of the abdominal wall may be seen in women in the second half of pregnancy and attributes them to the intra-uterine respiratory movements of the fetus. POEHL has investigated the action of spermin or extract of the testis, and has obtained a substance having the formula  $C_{10}H_{20}N_4$ ; and LODÉ has made the curious calculation,

showing the prodigality of nature, that the number of spermatozoa in one ejaculation is upwards of two hundred and twenty-five millions, and that for one Graafian follicle eight hundred and forty-eight millions of spermatozoa are formed. It has generally been concluded that amyloid substance is a pathological product, but KRAWKOW points out that it is closely related to chitin and to colloidin obtained from colloid carcinoma.

#### *Pathology.*

The vast amount of pathological research that is now being carried on in laboratories in all parts of the civilised world, and which finds a record in scientific periodicals, renders it impossible to do more than indicate here a mere fraction of the additions to knowledge that are being made in this direction. Even the year-books which are specially intended to summarise these writings must find it difficult to collate all that is being done. As concerns this country it is fitting to mention the appearance this year of a *Journal of Pathology*, of which two numbers have been issued. The lack of such a medium of publication in addition to the Transactions of Societies has long been felt here, and the favourable auspices under which the new journal has appeared together with the high quality of its contributions seem to have already ensured it a prosperous career. As to the general subject-matter of pathological investigation there is no question that the foothold obtained by bacteriology becomes yearly more and more stable; and the question which is at present most engaging attention is the difficult but highly important one of the nature of the changes which produce immunity from the results of microbial viruses. Of the fact of such immunity—whether spontaneous or acquired—there is no dispute. It is one of the proven facts of science. But opinion is sharply divided as to the manner in which it is brought about—a division well shown in the interesting debate at the Pathological Society of London in the spring. A great deal turns upon the topic of phagocytosis, upon which Professor METCHNIKOFF has thrown so much light; but whether this remarkable process, quite as much physiological as pathological, is solely, if indeed mainly concerned in the production of immunity from infective disease, or whether it is in this respect supplemented or supplanted by the chemical action of the fluids of the body, are indeed moot points. The arguments are weighty on both sides. Although neither can be said to have come off victorious, much fresh knowledge has accrued from all that has been said and written in support of one or other view. The discoveries of the Drs. KLEMPERERS on the pneumonic virus, of Drs. BRIGGER, FRÄNKEL and SIDNEY MARTIN in diphtheria, of Dr. KITASATO, Dr. CATTANI and others in tetanus, are all in the same direction—that, namely, of emphasising the importance of the study of the toxins produced by bacterial life as the chief thing in the production of the phenomena of infective diseases. No one can doubt that it is not so much in its biological aspect as in its chemical that the future development of the parasitic theory of transmissible diseases will be made. It is important to note that renewed researches are being made to elucidate the mysteries of malignant growths by reference to parasitism; and several valuable and suggestive inquiries have been made which tend to show that the alleged parasite is of microzoic rather than micro-phytic nature. Should this really be so, the ingenuity of investigators will have to be turned

in the direction of discovering media for the cultivation of these protozoic organisms if the conclusions are to be based on evidence as sound as that which now obtains for many specific diseases. The most recent study of the morphology of these "cancer organisms" is that by Drs. RUFFER and WALKER in the second number of the *Journal of Pathology*; whilst inoculation experiments on animals have been made by Drs. FISCHER, DUPLAY and CAZIN with negative result, attributable to natural immunity on the part of the animals inoculated. To demonstrate the real nature of malignant disease may of course not immediately result in more efficient methods of dealing with it, but it will be an advance capable of infinite extension and application and do much to stimulate exertion towards its more effective treatment. One of the notable monographs of the year was that on amœbic dysentery by Drs. COUNCILMAN and LAFLEUR of the Johns Hopkins Hospital, Baltimore—a paper conclusive in its results as to the etiological connexion between these protozoic organisms and dysentery, and as important in its way as the demonstration of the plasmodium malarie by Professor LAVERAN. As regards other diseases it may be noted that the announcement of the discovery of a bacillus in measles by Drs. CANON and PIELICKI of Berlin brought to mind the much prior claims of BRAIDWOOD; that in typhoid fever the question of identity between EBERTH'S bacillus and the bacillus coli communis has been raised, and that the advent of cholera has opened the way to studies upon its microbe and toxins, with the alleged demonstration of a method of producing immunity. The study of the blood in health and disease is being ardently pursued in many quarters. Drs. DALAND and SADLER have made numerous observations in hæmatometry in various affections; Dr. A. GARROD has conducted a similar inquiry in rheumatism; and a monograph on the general subject has been written by Dr. von LEMBECK. Dr. W. HUNTER'S recent lectures on hæmolysis were remarkable for the completeness with which he carried out his observations on a rarely explored ground. Sir W. ROBERTS has, in his Croonian lectures, enunciated many important facts upon uric-acid gravel and gout, and a new theory of renal dropsy enunciated by Dr. DICKINSON gave rise to a prolonged debate at the Medico-Chirurgical Society. Finally, amongst a few of the notable publications and republications of the year may be noted the work on Epidemics in Great Britain, by Dr. C. CREIGHTON; that on Ligature of Arteries, by Messrs. BALLANCE and EDMUNDS; the English edition of Papers on Acromegaly, by Dr. MARIE and others, issued by the New Sydenham Society; and the welcome volume of Dr. H. G. SUTTON'S Lectures on Medical Pathology.

#### *Therapeutic Progress.*

The occurrence of two epidemics during the year has necessarily diverted a great deal of attention from progressive study. Influenza in the earlier part of the year and cholera in the autumn produced a crop of specifics of which little need be said beyond noting that the efficacy claimed for them was, as usual, greatest during the decline of the epidemics. Notwithstanding these causes of instability a great deal of steady, honest work has been done towards giving greater precision to the knowledge of the value of older remedies, and also towards the investigations of the claims of the many new drugs which are ever at

our gates. One most curious phase of the year has been the persistent effort to prove the utility of various extracts and juices derived from the animal kingdom. This has been most marked in the treatment of myxœdema; extract of thyroid gland has been injected subcutaneously; patients have been fed on fresh thyroid glands, and an extract of thyroid gland has also been given by the mouth, while, from the surgical side, several cases of thyroid grafting have been reported. Dogs' serum has been used in tuberculosis and ox serum in syphilis, and it is reported that the serum of lambs' blood gave equally good results in the latter disease. Injections of testicle juice have been employed in cancer and in tuberculosis, while an extract of supra-renal capsules is said to have renewed vitality in moribund animals. Another subject that has attracted considerable attention is the employment of normal salt solution in various forms of collapse, whether due to vomiting, diarrhœa or profuse hæmorrhage, such as that occasionally met with in midwifery. In the last class of cases rectal injections of salt solution have also been advocated. The value of digitalis in various forms of cardiac failure has given rise to considerable discussion; although some writers have urged that it should be used in aortic regurgitation, and others have held that it is dangerous in this condition, there seems to be a general consensus of opinion that its employment should be determined by symptoms of cardiac failure, whether this failure be associated with aortic or mitral regurgitation. At the meeting of the British Medical Association at Nottingham a discussion was held upon cardiac tonics, when the value of digitalis was again considered in its relation to other cardiac tonics; experience appeared to indicate that the simultaneous use of caffeine and digitalis would often be more effectual than an increased dose of digitalis alone. The cardio-vascular action of theobromine and caffeine has been further investigated; under erythroplœim patients with heart disease are said to breathe more freely, but an examination of the physiological action of the active principles of urechites suberecta indicates that from its cumulative properties its future employment as a cardiac tonic is improbable. Arsenite of copper in anæmia, the use of atropine as a hæmostatic and the value of camphorated oil in cases of collapse have also received attention. The administration of oxygen in various acute respiratory affections led to numerous communications; it was employed together with strychnine in pneumonia, alone in a severe case of broncho-pneumonia following influenza, and it was also recommended in asthma and in convalescence,—massage, electricity and oxygen being regarded as substitutes for change, exercise and sea air. Rectal antiseptic injections in epidemic influenza, and in advanced phthisis with large cavities, have once more received commendation. Phthisis has also been treated with creasote, guaiacol, camphoric acid and cantharidates, but increased experience with the last named has given rise to some anxiety owing to the frequency of consecutive albuminuria. In the treatment of vomiting hydrochloric acid and strontium bromide have been recommended; chlorobrom has been used for sea-sickness and solanine for painful disorders of the stomach; orexin hydrochlorate has somewhat gained in favour as a stomachic and aid to digestion; salicylate of bismuth has been used in infantile diarrhœa and lactic acid in

many other forms of diarrhœa, having given good results even in phthisis. Much has been written of the value of glycerine in the treatment of hepatic colic, for which, when due to gall-stones, large doses of olive oil have also been recommended. Thymol has been vaunted as an anthelmintic, but its range of application appears to be very restricted.

The therapeutic researches connected with the work of the kidney have occupied a limited range, although they have been of much importance. The action of diuretin has been studied both experimentally and clinically; in some cases it appeared to cause diarrhœa, in others the amount of urine passed seemed to decrease rather than increase, but it has nevertheless been used with great satisfaction in many cases of cardiac dropsy. Lactose, glucose and copaiba balsam have also been employed as diuretics. The Croonian lectures on the chemistry and therapeutics of uric-acid gravel and gout must also be mentioned in this connexion. An interesting question has been raised as to the action of quinine in malaria and the possibility of the associated hæmaturia being the result of quinine or being made worse by it. Contradictory statements have been made regarding the action of syzygium jambolanum in diabetes mellitus, and the propriety of relaxing the usual and rigid dietetic restrictions in diabetes has been dealt with in our columns. Salts of strontium have been recommended for the albuminuria of nephritis, and methylene blue, which deeply colours the urine, has been suggested in the treatment of neurotic patients.

Exalgine has been used with some advantage in chorea, but for the relief of pain it appears to be somewhat disappointing. Bromamide has been employed in a number of ill-defined cases of neuralgia. Carbolic acid has been injected hypodermically for tetanus. Hydrastinin, pilocarpine and bromide of strontium have been used in epilepsy. For the production of anæsthesia penthal has been introduced, but in several cases it has given rise to alarming symptoms and it can hardly be considered a safe remedy at present. The same applies to bromide and chloride of ethyl as anæsthetics. The bearing of recent physiological and chemical research on the question of anæsthesia formed one of the subjects discussed at Nottingham, while the toxic action of impure chloroform and the comparative action of different brands of chloroform have been closely studied. The search for new hypnotics happily appears to be on the wane; trional and tetronal are said to be more prompt than sulphonal, but not superior to hyosine in cases of great mental excitement. Further experience has emphasised the inconveniences of sulphonal, its tardy action and the persistence of its effects; hyosine has again given cause for anxiety; paraldehyde has received praise both as a hypnotic and diuretic, and somnal—a new hypnotic—has not been sufficiently employed to allow of definite conclusions.

The treatment of diphtheria has been discussed at St. Petersburg, and during the year papers have appeared recommending for this disease the use of petroleum, antipyrin, tannin, zinc chloride and the removal of membrane and application of antiseptics. Typhoid fever has also been assailed by newer methods; chloroform in repeated small doses, calomel, salicylate of soda, creasote, naphthalin and alpha-naphthol have found adherents. Methylene blue and phenocol have been recommended in malaria, naphthalin in whooping-

cough, salipyrin in rheumatism, and paracresotic acid as an antipyretic.

The morality of the opium question and the ethics of opium and alcohol have been discussed in our columns at some length. The antidotal action of chloride of gold against snake poison has been disputed. Pilocarpine has been recommended in prurigo senilis and in selected cases of labyrinthine deafness, as have dermatol and europhen in syphilis and hydrogen peroxide as a diagnostic agent for detecting the presence of pus; inoperable malignant neoplasms have been treated by aniline dyes, and a possible future for toxines as new therapeutic agencies for the cure of infectious diseases has been forecast. Amongst the legion of newer remedies the following may be mentioned: Solveol, solutol, thymacetine, saprol, hæmol, hæmagallol, losophan and salophen, the last named being a convenient abbreviation for a combination of salicylic acid with acetyl-paramido-phenol ether. Where not influenced by passing fashion the therapeutic work of the year has been characterised rather by consolidation than by novelty and reconstruction.

#### *Surgery.*

The year that is just closing has not been marked by any epoch-making discovery or advance in surgery. But it would be idle to deny that surgery is a steadily advancing art and science, and that each year some gains are to be reckoned. When the history of surgery in the nineteenth century comes to be written the latter half will be seen to be the period of the greatest progress attained since the art was first practised. Surgical pathology has been revolutionised and surgical therapeutics have been to a large extent established upon a true scientific basis. Surgery has become at once more successful and more responsible. Our ability to control results has added a new weight to those borne by our predecessors. They when met by failure and disaster could only shrug their shoulders and appeal to Providence. We, however, know that such failure is generally to be traced to some error of omission or commission of our own. In all branches surgery is becoming more and more exact, and the old rough and inexact methods will soon be as extinct as the dodo. For an acute abscess the lancet and poultice are now not used, but the aseptic knife and careful antiseptic dressing. For a boil or carbuncle the old-fashioned crucial incision has been relinquished, being replaced by the removal of all the infective slough and tissue; and so through all the range of operative surgery. Thus excision of joints is replaced to a very large extent by arthrectomy. In operating for cancer of the breast it has been shown that it is very important to remove the entire gland, including all outlying nodules, the fascia over the pectoralis major muscle, the axillary lymphatic glands and the strand of tissue containing the lymphatic vessels passing from the breast to the glands. This is not empirical, but the result of painstaking pathological investigation and demonstration. The enucleation of tumours of the thyroid body is becoming more generally recognised as preferable to the drainage of cysts, the scraping out of soft tumours or excision of a part or the whole of the thyroid gland. This is a distinct advance. Again, the practice of applying a ligature to the main artery close above an aneurysm has been practised of late with great success. Such an operation, when conducted without infection of the wound, is shown to be unattended with the risks previously asso-

ciated with it, and to be free from some of the disadvantages, such as recurrence of the pulsation, which belong to the Hunterian operation. Less and less is heard of the treatment of aneurysm by compression, as surgeons' confidence in their ability to conduct an aseptic ligature of an artery has increased. In abdominal surgery much is being done to place the treatment of diseases and injuries of the stomach and intestines upon the same satisfactory footing as that of diseases of the ovary. If the success has not been all to be desired, it is nevertheless highly encouraging. Lumbar colotomy is fast giving place to the inguinal operation, and excision of the rectum is established as an effective operation. In the practice of asepsis two things are forcing themselves more and more on surgeons' notice—the danger of infection through the organisms contained in the skin of the patient and on the surgeon's instruments and fingers and the little risk of infection through the air. Much greater attention is paid to the cleansing of the patient's and the surgeon's skin and more efficient means are used for the thorough cleansing of surgical instruments. Heat is the most trustworthy antiseptic and instruments are now commonly sterilised by dry or moist heat, the simplest and best means of all being to boil them for a short time in a 1 per cent. solution of bicarbonate of soda; this appears to be fatal to every bacterium and spore.

#### *Obstetrics and Gynæcology.*

The year now closing, like its predecessor, has witnessed a great activity in operative procedures and in the recording of results at the various societies devoted to obstetrics and gynæcology throughout the country. As a rule, little or no mention has been made of the treatment of the diseases peculiar to women by drugs or remedial measures short of surgical operations—a department of therapeutics which we think is being somewhat overlooked by the societies. At the meeting of the Obstetrical Society of London in January Dr. HERMAN gave an interesting analysis of the cases of nearly four thousand consecutive out-door patients at the London Hospital, from which he concluded that there is a marked relation between backward displacements of the uterus and prolonged hæmorrhage after delivery. At the same meeting Dr. INGLIS PARSONS brought before the Society his results of APOSTOL'S method of treatment by electrolysis of fibromata and various morbid conditions of the uterus, which caused considerable discussion. These results were encouraging to the advocates of this treatment, for in fourteen of the cases of fibromata the hæmorrhage was reduced in all, in six of which no relapse took place, and in one the tumour entirely disappeared, pregnancy subsequently occurring. His general conclusions were that electrolysis when properly employed arrested growth in most cases and might even reduce the size; that it arrested hæmorrhage in nearly all and, as a rule, relieved pain and pressure symptoms. Dr. WATT BLACK, in his presidential address, dwelt especially on the losses during the previous year of Drs. BENNET, FORDYCE BARKER, CARL BRAUN and SCANZONI. At the meeting in March three papers on Cesarean Section were read by Drs. CULLINGWORTH, LEITH NAPIER and SHAW, and a discussion of the subject occupied two meetings, and amongst others Dr. MURDOCH CAMERON of Glasgow related his interesting experience. At a subsequent meeting the relative position of Craniotomy and Cesarean Section

was discussed. In October Dr. CULLINGWORTH read a very interesting paper on the Value of Abdominal Section in certain Cases of Pelvic Peritonitis based on an Experience of Fifty Cases. The important question debated was whether surgical interference was or was not frequently called for in cases of pelvic peritonitis. Dr. RENTOUL communicated to the Manchester Medical Association a lengthy paper dealing with the proposed registration of stillborn children. The Fellows of the Edinburgh Obstetrical Society have shown considerable activity during the year and some very interesting and valuable contributions have been made. Amongst others, Dr. BERRY HART communicated a paper on the Alleged Growth of the Placenta in Extra-uterine Gestation after the Death of the Fœtus. This paper is of value in tending to clear up some difficult points in pathology. A contribution on the Structure of the Human Placenta, with Special Reference to the Origin of the Decidua Reflexa, by Drs. BERRY HART and G. LOVELL GULLAND, showed a great amount of careful investigation, which was undertaken to endeavour to explain the overwhelming frequency with which the fertilised ovum grafts itself on the uterine cavity. Dr. J. CLARENCE WEBSTER communicated some interesting details regarding the Female Pelvis in the Fifth Month of Pregnancy. He has also written an instructive work on the Anatomy of the Female Pelvis during the Puerperium—the result of his investigations carried on in the laboratory of the Royal College of Physicians of Edinburgh. An important feature in regard to the literature of Diseases of Women is the translation by the New Sydenham Society of a new edition of the excellent Treatise on Clinical and Operative Gynecology (reviewed in our last issue), by Dr. POZZI, Surgeon to the Lourcine-Pascal Hospital in Paris—a work not limited to a French view of gynecology, but recording the labours of practitioners in our own and other countries.

#### *Ophthalmology.*

The death of Sir WILLIAM BOWMAN at an age when he could still enjoy the learned leisure he had so well earned by a long and earnest devotion to science and to practice has removed from the scene the most conspicuous worker of late years in the important department of ophthalmology. His works live, and by their truth, not less than by their originality, have won for themselves a high and permanent position in medical literature. The lecture founded by the Ophthalmological Society in his honour was this year delivered by Professor LEBBER of Heidelberg, who gave to an appreciative audience a summary of his careful investigations into the pathological processes which take place in the cornea and other tissues of the eye, as the result of punctures with needles charged with the spores of certain fungi. The observations he has made are of great interest, since they show that the spores of *aspergillus fumigatus*, for example, find a soil congenial to their growth in the substance of the cornea and that, probably through their excreta, the germinating spores kill the adjoining area of the membrane, whilst remarkable, not to say conscious, efforts are made by the leucocytes of the blood, which form a ring round the affected region, to limit and define their injurious action. Pursuing a similar line of research M. GILLET DE GRANDMONT has been able to obtain pure cultures of various fungi chiefly belonging to the staphylococcus form, which he has

collected from corneal ulcers; whilst a distinguished practitioner, M. DE WEOCKER, has gone so far as to predict that in the near future it will be proved that all inflammatory affections of the cornea are of microbic origin. In accordance with this view he has devised a kind of shield which can be adapted to the parts surrounding the eye, and then becomes capable of retaining a quantity of antiseptic fluid in contact with the cornea. The employment of chlorine water, either pure or diluted, has been recommended by several ophthalmic surgeons of large experience in various forms of inflammation of the cornea on account of its powerful antiseptic action. Its application even when undiluted appears to be attended with but little pain, and such pain can easily be removed by the instillation of a few drops of a 4 per cent. solution of cocaine. The Graefe prize for the advancement of ophthalmological knowledge has been awarded to VON HIPPEL for his fairly successful efforts to effect the transplantation of the cornea. The principal feature in his method of treatment consists in the removal of a small area only of the cornea, taking care to preserve intact the membrane of Descemet, the whole proceeding being conducted under very strict aseptic conditions. Some of his results appear to have been excellent, the transplanted cornea retaining its transparency for many months. In this country the more severe forms of granular lids are rarely seen, but on the Continent the disease is of common occurrence and the heroic remedies to which the surgeon is apt to resort are well known in the method of treatment strongly recommended and practised by DARIER and ABADIE, which consists in placing the patient under chloroform, everting the lids with or without division of the outer canthus as may be required by the exigencies of the case, scarifying the granulations and then, which is the capital point of the method, brushing the surface with a brush having short stiff bristles, the surface being subsequently washed with a solution of corrosive sublimate and covered with iced compresses. This method, severe as it is, is said always to ameliorate and sometimes to cure the patient, yet the possibility of forming cicatricial bands should not be overlooked. The vexed question of the existence of a dilator muscle in the iris acting in opposition to the sphincter has been attacked by Mr. LANGLEY and Dr. ANDERSON, who, from a review of the evidence for and against the presence of such a muscle as well as from their own observations, think that the probabilities are in favour of the explanation that the sympathetic nerve causes a dilatation of the pupil, not by producing a contraction of the radially arranged blood-vessels, but partly by causing contraction of a dilator muscle and partly by occasioning inhibition of the sphincter muscle. In connexion with this subject it may be mentioned that NAWROCKI and PRZYBYLSKI have satisfied themselves by experiment that the dilator nerves of the pupil descend from the encephalon into the spinal cord, emerge by the anterior roots of the eighth cervical and the first and second dorsal nerves, then enter the rami communicantes, and thence pass into the loop of Vieussens. The cervical sympathetic and superior cervical ganglion then penetrate the skull and join the Gasserian ganglion and accompany the ophthalmic division. They reach the iris by the long ciliary nerves and do not enter the lacrymal ganglion. The curious observation of Dr. BROWN-SÉQUARD that the iris responds directly to the action of light, even when the globe of the

eye has been divided into an anterior and posterior half and when, therefore, all central nerve influence must have been abolished, has been corroborated by STEINACH, who attributes the contraction to the action of light upon certain pigmented muscle fibres, for movement is still observed when the nerve elements of the iris have been paralysed by atropine. Very careful measurements of the images of Purkinje made by TSCHERNING have led him to the conviction that towards the end of the act of accommodation the lens undergoes displacement downwards, a movement that centres the eye, but its axis always directed two degrees below the visual line. A very long and exhaustive report of a committee on colour vision was presented to the Royal Society who, in the course of the past summer, have held many meetings and examined a large number of persons. The committee have recommended that the Board of Trade, or some other central authority, should schedule certain employments in the mercantile marine and on railways, the filling of which by persons whose vision is defective either for colour or form, or who are ignorant of the names of colours, would involve danger to life and property. The testing for all candidates should be compulsory. They recommend HOLMGREN'S coloured wools test for colour and SNELLEN'S tests for form. It is to be hoped that the recommendations contained in this report will be fully carried out.

Besides Sir WILLIAM BOWMAN, others whose names are well known in Ophthalmology have passed away. Amongst these are Professor WHARTON JONES, who was for many years connected with University College Hospital; Sir GEORGE AIRY, the late Astronomer Royal, the defect of whose own eyes led him to recognise their error of refraction, to which he applied the term "astigmatism," and to devise the means for correcting it; ERNEST BRÜCKE, the distinguished Viennese physiologist, whose anatomical description of the eye of man, researches on subjective colours and discussion of the YOUNG-HELMHOLTZ theory of colour are well known. The first part of a treatise on the diseases of the eye by HIRSONBERG, which promises to be good when completed, has been published, and new editions of the manuals of SWANZY, FUCHS, VOSSIUS and others. Amongst the smaller treatises on special subjects are those of SNELL on Miner's Nystagmus and of ERNEST CLARKE on Eye Strain.

#### *Dental Surgery.*

The subject which has raised the most lively interest and discussion this year is probably the question of "anæsthetics," especially with regard to the administration of a mixture of oxygen with the ordinary nitrous oxide. Mr. BRUNTON of Leeds, in a paper read before the British Dental Association, advocated where many teeth required removal the employment of the extended or "Howard" position of the patient—that is, with the head hung back quite below the end of the couch—a position which is safer and after a little practice gives the operator no more trouble than the ordinary one. Chloride of ethyl seems to be gaining popularity as a local anæsthetic and can be now obtained in tubes with screw tops, so that the quantity desired may be used without the loss of the remainder. Of new antiseptics hydro-naphthol is the only noteworthy one which serves as a mouth wash, a dressing, or in the form of a tooth-powder. The statistics with reference to the average of caries of the teeth amongst school children have been unremittingly investi-

gated by the committee appointed by the British Dental Association, and show a very serious and unexpected amount of disease. A report of Dr. LAUFER with regard to the teeth of Russian children points to very much the same conclusion. Mr. HOWARD MUMMERY has added to the store of knowledge on the subject of the pathology of the teeth and the part which bacteria take therein. The subject of pathology is now considered so important that it is proposed to institute a professorial chair of bacteriology at some of the dental schools. Politically the most important step taken during the year and one which cannot prove to be other than of benefit to the public and the practitioner is the decision of the General Medical Council to put a stop to "covering."

#### *Chemistry.*

Inorganic chemistry has again been a favourite field of investigation. Since Mr. CROOKES' brilliant spectroscopic researches and his important observations on the genesis of the elements grave doubts have sprung up in many minds as to the elementary character of the bodies now called "elements," and it is extremely probable that many of them will after all turn out to be compounds. The spectroscope promises to lend valuable aid in demonstrating this. From the results of a long investigation by Mr. PARRY, for example, it would appear that iron is a very complex body and there is every indication that this metal will after all prove to be a chemical compound or, if not, an element subject to considerable allotropic modification. Further particulars of the interesting element fluorine, which was recently isolated, are given by its discoverer, M. MOISSAN. The colour of fluorine is paler than that of chlorine, but decidedly more yellow; its spectrum consists of thirteen bright red lines. M. TESLA'S lectures on alternating currents of high potential and frequency have attracted considerable notice. By M. TESLA'S researches a way has been opened up into a new region of inquiry. A new compound of carbon with barium ( $C_2Ba$ ) is described by M. MAQUENNE, and is interesting chiefly on account of the readiness with which it yields remarkably pure acetylene when treated with water. The metal boron has been obtained in a state of purity by M. MOISSAN of fluorine fame. Professor THORPE and Mr. A. E. TUTTON have investigated the properties of phosphorus trioxide and have made some interesting observations. Not the least important of these is that the disease of the lower jaw acquired by persons employed in making lucifer matches is traceable to the action of the volatile phosphorus oxide which is largely formed when phosphorus ignites without firing. Limettin ( $C_{11}H_{10}O_4$ ) is a crystalline substance discovered by Professor W. A. TILDEN in the essential oil of the lime. M. GENVRESSE has discovered an interesting and simple mode of synthesising tartaric acid from glyoxalic acid, which is calculated to throw some light upon its natural formation, more particularly as glyoxalic acid, the starting-point, is closely related to oxalic acid, which, as is well known, occurs naturally in certain plants. Mr. CROOKES, by employing alternating currents of enormous voltage, obtained visible flames composed mainly of burning nitrogen. The nitrogen of the air may thus be directly burnt into a powerful acid—nitric acid. Dr. LEBEL has also shown that the passage of electrical discharges through air (as lightning) results in the formation of nitric acid and nitric oxide. Mr. LUDWIG MOND has con-

tinued his researches on the action of carbon monoxide gas on metals. He has obtained two iron compounds,  $\text{Fe}(\text{CO})_6$  and  $\text{Fe}_2(\text{CO})_7$ . The compound  $\text{Fe}(\text{CO})_6$  is formed when CO gas is passed over heated pure iron; the metal may be deposited on articles by merely immersing them in the resulting vapour. All attempts to "give wings" to other heavy metals, with the exception of nickel and iron, have failed. The compounds thus obtained are called "carbonyls."

The synthesis of azoimide ( $\text{N}_3\text{H}$ ) (a very unstable and explosive body) has been effected by Professor WISLIÖENUS. Professor RAMSAY has investigated the impurities of chloroform. When the purest chloroform obtainable was exposed to light between March and July he found that it emitted an acrid odour when opened, due to the formation of phosgene gas (a compound of carbon monoxide and chlorine,  $\text{COCl}_2$ ,  $(2\text{CHCl}_3 + \text{O}_2 = 2\text{COCl}_2 + 2\text{HCl})$ ). The subject of flames has been vigorously attacked during the year by two able but independent investigators, Professors SMITHIELLS and LEWES. The latter finds that the heavy hydrocarbons which occur in the non-luminous part of the flame are almost entirely converted into acetylene before they reach the luminous zone. In his opinion the luminosity of flame is therefore brought about by dissociation of the acetylene. Professor SMITHIELLS' experiments led him to conclude that when the hydrocarbon is starved of oxygen the carbon burns preferentially to the hydrogen. Experiments upon the possible effect of long-continued applications of a copper sulphate spray used as a fungicide have been made in New York. In the soils containing copper more seeds germinated in almost every case than in the soils containing no copper. Analysis of the tops of tomatoes grown in the 5 per cent. soil showed 0.06 per cent. copper, proving conclusively that these plants can take up sulphate of copper by their roots. Grapes also were found to contain  $\frac{1}{100}$  gr. of copper per pound—a negligible and harmless quantity probably. Fluor-sulphonic acid has been obtained in a pure state by Professor ПЮРПЕ by acting on hydrofluoric acid with sulphur trioxide; it combines with water with extraordinary violence. Aluminium as a useful metal is rapidly coming to the front. It is produced more cheaply and is finding consequently a more extended application. Major VON SILLICH, to mention one application, has found that aluminium gives a stroke on slate, and a German company has undertaken the manufacture of pencils based on this fact. They need no pointing and are well-nigh inexhaustible and unbreakable. The writing, which may be erased with a wet sponge, is as clear as with ordinary pencils and requires little more pressure. Aluminium also is largely used now for the manufacture of lenses, opera-glasses, scientific instruments &c., the advantage derived from its exceeding lightness being in some cases considerable.

Chemical science has this year sustained irreparable loss by the death of many of its most able investigators. Amongst them are such famous names as Professor KARL SCHORLEMMER, LL.D., F.R.S., Dr. T. STERY HUNT, Professor J. W. HOFMANN, Professor HERMANN KOPP, and Mr. A. NORMAN TATE. The following books have been the most important additions to chemical literature:—"Watts' Dictionary of Chemistry," Vol. III., by H. FORSTER MORLEY and M. M. P. MUIR; the "Chemistry of Paints and Painting," by A. H. CURRIE, M.A., F.R.S.; and a "Manual of Chemical Technology," by RUDOLF WAGNER, translated

and edited by W. CROOKES, F.R.S. An event of interest during the year was the presentation of an address to the eminent *savant* Professor BUNSEN, by the Chemical Society, on the occasion of his attaining his fiftieth year of foreign membership.

#### Public Health.

A number of considerations have affected the condition of Public Health during the past year. In the first quarter the death-rate exceeded that for any corresponding quarter since 1879, the excess being largely due to epidemic influenza; and the deaths amongst people over sixty years of age were no less than 32.9 per 1000 above the average. During the next two quarters the general death-rate was below the average, but as the summer advanced a considerable outbreak of scarlet fever prevailed in the metropolis. This outbreak was never excessive in point of fatality; during a number of weeks when it was at its highest the death-rate was below the decennial average; but owing to notification, to the removal of the stigma of pauperism on those using the hospitals belonging to the Metropolitan Asylums Board, to the excellent repute attained by those hospitals, as also to the increasing demand on the part of the public for means of isolation, the strain upon the Managers was very severe. Early in November a diminution of the epidemic set in and it is now rapidly abating.

Cholera next appeared upon the scene. Travelling slowly from the valley of the Ganges through Persia and Afghanistan, it traversed Russian Turkestan, and early in the summer had attacked ports on the eastern and southern shores of the Caspian, whence it found its way into Transcaucasia and European Russia, and diffused itself very generally throughout European Russia. Aided probably by the emigration of Russian Jews it suddenly appeared in Hamburg; it spread in various parts of Northern Germany, of Belgium and of Holland, and was also conveyed to ports of the United States by European emigrants. Later in the year cholera also spread into Austria-Hungary. From North Sea ports, and notably from Hamburg, isolated cases reached this country, the first importation taking place on Aug. 25th. But earlier in the year cholera had already broken out in the suburbs of Paris; it was first called "cholérine" and its real nature seems to have been misapprehended. The disease, however, remained prevalent and spread to a considerable number of towns and places in the north-west of France, a notable epidemic occurring at Havre—indeed, some observers are induced to regard the Hamburg epidemic as due to an importation from France rather than to the movements of Russian Jews. Be this as it may, France has been very markedly infected, and the infection is still manifesting itself in certain localities, notably in Brittany. We do not propose to discuss in any detail the course or extent of the European cholera epidemic of 1892; its complete history has yet to be written, and our columns have already been largely occupied with accounts of its general progress and with carefully compiled reports of its special incidence on certain countries and towns. As regards this country we would recall the fact that between Aug. 25th and Oct. 18th twenty-nine cases of cholera occurred in England, that all the attacks took place in persons arriving from infected places on the continent of Europe, and that in no single instance was there any spread of the disease. This result

was largely due to the activity displayed by the Medical Department of the Local Government Board and the sustained labours of port health officers. But notwithstanding this a demand arose in certain ports for quarantine restrictions and for power to destroy numberless articles arriving from abroad on the ground that they might convey infection. The first of these requests probably received its deathblow at the recent meeting of port health officers at the Mansion House, and the second did not succeed in securing any extension of prohibition beyond that which was already in force as regards rags and the bedding of immigrants.

But the true test of our system of sanitary organisation against cholera has yet to come. We cannot impose any such restrictions on trade and traffic as will with certainty prevent extension of the disease beyond our ports, and hence it becomes of the utmost importance that sanitary reform should be actively carried on in our inland districts. Recurrence of cholera must be looked upon as a most probable contingency next spring and summer, and reform is notably necessary as regards water-supplies, many of which are notoriously open to sewage or excremental contamination at their sources. With the object of securing the utmost available protection against this disease, a cholera survey is forthwith to be instituted by the medical staff at Whitehall; but no such survey can produce effective result unless the sanitary authorities and the public whom they represent determine to remedy those conditions which are known to be favourable to cholera extension.

For the moment another disease—namely, small-pox—seriously occupies the attention of public health authorities. It is very widely distributed throughout the northern half of England; in several places—such as Warrington—it has assumed epidemic proportions, and it is now spreading to places in the midlands and in the south, including the metropolis. The danger of a wide prevalence of this disease during the ensuing spring is the greater because of the season of the year in which the present distribution is showing power of further extension, and because of the growing neglect to enforce the provisions of the Vaccination Acts which has marked the period during which the Royal Commission on Vaccination has been sitting. In London the danger of an epidemic extension has been in part removed by reason of the system under which the isolation of small-pox patients has been carried out in the neighbourhood of populations; but in provincial towns the matter is different, and the Warrington experience seems to point strongly to the danger of aggregating such patients in the neighbourhood of dwellings.

Diphtheria is another disease which is causing anxiety, and its present spread and mortality in the metropolis afford a further confirmation of the view that this disease, formerly so closely identified with rural areas, is gradually taking its place as a serious cause of death in urban centres. By many persons the increase is attributed to ordinary sanitary defects of sewerage, water-supply &c., notwithstanding the fact that the incidence of the disease in our towns has corresponded with the precise period during which the greatest progress has been made in such matters in urban areas. Reviewing recent investigations into the etiology of this disease we are strongly inclined to regard its spread as more likely to be due to the development of throat affections amongst children aggregated in elementary schools and the

use of milk from cows suffering from an analogous disease than to other causes.

Some important changes have been made during the year in the staff of the medical department of the Local Government Board. Sir GEORGE BUCHANAN, after long and distinguished service, retired last April from the post of medical officer, receiving the honour of knighthood on the occasion. He was succeeded by Dr. THORNE THORNE, C.B., whose post as senior assistant medical officer was filled by Mr. W. H. POWDER. Other changes followed, and the medical staff has, we believe, just been strengthened by the addition of two permanent inspectors, as also by the appointment of four temporary inspectors, to assist in performing the additional duties which it is expected will devolve on the medical department during the ensuing year. During the past year cholera largely occupied the attention of the staff; but further progress was made with the investigations into the causes and intimate pathology of epidemic influenza, the current work was maintained and amongst some of the more important reports issued were two on enteric fever in Rotherham and the neighbourhood and at King's Lynn, and one on typhus fever at Wigan. The two former reports have a strong bearing on the subject under the consideration of the Royal Commission on Metropolitan Water-supply, especially in reference to the need for maintaining a standard of purity in the sources of our public water services beyond that which at present prevails in many parts of the kingdom.

#### *Forensic Medicine.*

The year 1892 will be marked in forensic annals chiefly by the poisoning by strychnine of several "unfortunates" in London by THOMAS NEIL CREAM. A full account of the tragedy has been given in THE LANCET. Suffice it here to say that the criminal had led a roving life between this country and the American continent, that he had been imprisoned abroad for complicity in causing the death of a man by poison, and that he sought to fix his heartless and apparently motiveless murders on innocent people with attempts at blackmail. Two cases of murder somewhat resembling each other have been disclosed and the perpetrators convicted. We refer to the crimes of FREDERICK BAILEY DEEMING and ANDREW MCRAE. DEEMING was tried at Melbourne for the murder of his wife, whose body was found beneath the cemented floor with the skull broken and the throat cut. The murderer had disposed of a previous wife and her children in a similar way in this country, and the discovery of their remains—also cemented down—was made about the same time as the murder in Melbourne was brought to light. Insanity was set up in defence, but the plea failed, and DEEMING was executed. MCRAE's case is noticed in our present issue. For the first time since the passing of the Marriage Dissolution Act a plea of irresponsibility on the ground of insanity has been advanced in the case HANBURY v. HANBURY. The respondent was accused of acts of cruelty and adultery, and it was in answer to these that inebriety and recurrent attacks of mania were set forth as legal exonerations. The jury, however, ignored the contention, and found that the misdeeds were committed during the intervals of the attacks. An important alteration has been made by the Coroners Amendment Act of 1892, whereby several blots on the previous law have been removed. It is now legal for a deputy-coroner to discharge the duties of the

office rendered vacant by the death of his principal, whereas formerly he could only do so during the absence of the chief. Borough coroners, prior to the passing of the Act, were obliged to nominate barristers or solicitors as their deputies. Now this restriction has been removed. Lastly, a period of three months, instead of ten days, is now fixed as the period during which a coronership remains vacant. Poisoning by ptomaines contained in tinned foods has unfortunately been further illustrated, and some additional facts relative to the nature of the toxic substances have been made known. The subject, however, may still be regarded as in its infancy. Death after vaccination has on several occasions been investigated by coroners' juries, but in each instance it has been shown that vaccination has only had a secondary share in causing the fatal issue. Pending the report of the Royal Commission on Vaccination it is not necessary to add to what has recently been reported in *THE LANCET*. Death certification and registration has been the subject of a leading article, wherein we pointed out the prevalent abuses and suggested an appropriate remedy for them. Our records have shown that criminal abortion, baby farming and cruelty to children are still all too prevalent, but much has been done to expose the criminality and cruelty attendant on these illegal acts and, we trust, at the same time to lessen the frequency of their occurrence.

*The Royal College of Physicians of London.*

The year has been on the whole an uneventful one at the Royal College of Physicians. It has not even seen the determination of the legal question at issue between the College and the General Medical Council respecting the complete and independent character of the College licence, which has been called in question by the Council. The relegation of the Gresham University Charter to a Royal Commission induced the College to have its position in the matter laid before the Commission by the President (Sir A. CLARK), the Registrar (Dr. E. LIVING), and Drs. NORMAN MOORE and ALLCHIN. A noteworthy declaration of the College upon the question of the transfer of practices between Members and Fellows as being contrary to the traditions of the College "and derogatory to the position of a physician," has had its natural sequel in an addition to the College by-laws. In educational matters the scheme for a five-years' curriculum was somewhat hurriedly pushed through the College in conjunction with the Royal College of Surgeons,—a scheme which introduces important changes in the earlier and later parts of the student's career. The changes in respect to physiological teaching have not been such as to commend themselves to the schools, and will doubtless soon be subject to fresh revision; but the fifth year of clinical work has on the whole been well planned. The period of testing its efficacy has, however, yet to come. Sir ANDREW CLARK was chosen President for the fifth time, and he delivered on the occasion an address which dealt largely with the University question in which he has shown so much interest. A hastily convened comitia in the summer vacation issued a memorandum upon cholera at the request of the Local Government Board, but happily the occasion for its being acted upon did not arise. We had occasion to express our opinion on this memorandum at the time of its issue (*vide THE LANCET* of Sept. 24th). An influential committee has been appointed to undertake the decennial

revision of the nomenclature of diseases. By the resignation of Mr. W. GURNER of his office of bedell the College has lost the services of an old and valued official. The vacancy thus created was filled by the appointment of Mr. FLEMING. The Gulstonian lectures were delivered by Dr. SIDNEY MARTIN, who dealt with the chemical pathology of diphtheria compared with that of anthrax, infective endocarditis and tetanus; the Lumleian lectures on Certain Points in the Etiology of Disease were given by Dr. PYE-SMITH; and the Croonian lectures on the Chemistry and Therapeutics of Uric-acid Gravel and Gout were delivered by Sir W. ROBERTS. The Milroy lecturer was Dr. FRANCIS WARNER, who gave the results of an exhaustive Inquiry as to the Physical and Mental Condition of School Children; and the Bradshaw lecturer was Dr. GEE, who took for his subject the Signs of Acute Peritoneal Disease. Dr. BRIDGES delivered the Harveian oration, which was followed in the evening (St. Luke's Day) by the recently revived Harveian dinner.

*The Royal College of Surgeons of England.*

The year which has now closed will always be memorable in the history of the Royal College of Surgeons; for during it the important case of STEELE v. SAVORY was brought to a conclusion, the decision of the judge being given against the plaintiff as representing Members of the College; and there has been manifested a desire on the part of the Council of the College to extend the privileges of the Fellows. With regard to the trial mentioned above, the details are still sufficiently fresh in the minds of our readers to make detailed reference to it unnecessary. The Fellows and Members have gained a common room at the College, where they can meet, read the papers, write letters &c.; and the principle of calling the Fellows together separately from the Members for consultative purposes has been established. The first meeting of the kind was held on July 7th, after the election to the Council. The object of the meeting was said to be "to afford the Fellows an opportunity of expressing their views on any points they might wish to bring forward." The committee which recommended these changes also considered another question—the advisability of permitting Fellows to be present at meetings of the Council, but did not recommend it.

The ninth annual meeting of Fellows and Members was held on Nov. 3rd, when the report for the collegiate year was presented to the meeting by Mr. BRYANT, the President. The report, which was a full one, was noteworthy for the changes which had been made in the arrangement of its contents, the subjects treated of being placed under their various headings instead of being scattered in fragmentary reports of meetings of Council or committees, and were thus much more accessible to those taking an interest in the work of the College. The proceedings were without particular importance. It has been agreed to commemorate the jubilee of the Fellowship during the course of next summer, and a plan has been approved, the details for the carrying out of which have been handed over to a committee. At the annual election of Members of the Council Mr. THOMAS SMITH and Mr. DURHAM were re-elected, and Mr. TWEDDY and Mr. HOWARD MARSH were elected Members of the Council. Mr. THOMAS BRYANT was chosen President of the College for the third time; Mr. DURHAM and Mr. CHRISTOPHER HEATH Vice-Presidents (the former had held the officesince the

death of Mr. BERKELEY HILL early in the year). We have fully reported in the columns of THE LANCET the changes which have been necessitated in the examinations owing to the adoption of the five years' curriculum, also the changes which have been made in the composition of the various examining boards. Visitors to the College at the time of the election of members of Council were very much impressed and pleased with the changes and improvements which have been made in the buildings. It contains undoubtedly one of the most complete museums of the kind in the world, and the arrangements and furnishing of both museums and library are very satisfactory. It has been necessary to do a good deal to the drainage of the place and the expenditure of considerable sums of money has been called for. The Council considers, however, that it has now got to the end of the heavy expenditure and will be able to retrench. The needful improvements cannot, however, be considered as fully completed until the theatre has been reëcted; it is at present about the most uncomfortable lecture theatre we know of. The finances were not quite satisfactory, judging by the yearly report. There was then a balance of £450 in respect of revenue over expenditure, but the extraordinary expenditure of £11,209 for extension of the College premises and the Examination Hall buildings had necessitated a sale of £12,000 worth of stock. There is, however, about £1400 to be paid for drainage works, and it is doubtful if the balance expected next year will be realised. The loss of income from sale of stock will amount to some £200 a year. We would again urge some diminution in the present rate of ordinary expenditure for a time. The Bradshaw Lecture was given by Mr. CHRISTOPHER HEATH, who took for his subject Diseases of the Nose, and the Morton Lecture by Dr. SIMS WOODHEAD. No candidates sent in dissertations for either the Jacksonian or College Triennial Prizes. Mr. F. G. HALLETT has performed a useful task in compiling a catalogue of the busts and objects of art in the College. In addition to the loss of Mr. BERKELEY HILL, a Vice-president, the Council has received intimation of the death of several past members of its body, including EDWARD COCK, SAMUEL A. LANE, F. LE GROS CLARK, C. HAWKINS and JOHN WOOD.

*Army, Indian and Naval Medical Services.*

There is not very much to chronicle in connexion with the public medical services for the past year. Promotion has not been particularly active in 1892, but, as regards the Army Medical Staff, at any rate, it promises to be more so in the coming year. As regards the medical staff, moreover, it cannot be said that the adoption of the new military designations for medical officers has brought about a state of perfect contentment. It is difficult to find abbreviated titles for ordinary every day use. That of Brigade-Surgeon-Lieutenant-Colonel, for example, is a great mistake. It is manifestly such a cumbrous and lengthy designation that it cannot be generally used in military or social life. The medical officers desire to have their service made into a Royal Medical Staff Corps or a Royal Corps of Surgeons in place of the present organisation, and in that case the majority of them would prefer purely military titles to the present mixed ones. It must be remembered that all the recommendations contained in the report of Lord CAMPERDOWN'S Committee have never yet been carried out. The main points on which medical officers are desirous of seeing changes made, in

addition to the foregoing, are that, in the first place, as regards terms of foreign service, the old rule of five years for India should be reverted to. This is a very reasonable desire, for the increase in the length of foreign tours injuriously affects their health and is otherwise prejudicial to their interest. In the present depressed value of the rupee it cannot any longer be said that a medical officer obtains any financial advantage to recoup him for the risk incurred to health by additional service in India. Next, that the rank of Brigade-Surgeon should be officially recognised by the Indian Government; and, lastly, that more latitude generally should be given to medical officers to effect exchanges with one another, subject to the approval of their departmental head. There has been a good deal of discussion of late in regard to the extension of service beyond the age retirements laid down for medical officers. We have never concealed our opinion on this subject. As a matter of principle and as the only fair and just method of administration it seems to us that Royal Warrants and Regulations should be strictly adhered to in this respect. The retention of officers beyond age limits should be exceptional and for the good of the service only; and, as a rule, the officers so retained should be seconded in order to prevent blocks in promotion and consequent injustice to others. This applies, of course, to all the three medical services—Naval, Medical Staff and Indian Medical Service. A new Order has been issued to the effect that officers of the Army Medical Staff are in future to be detailed for general service in India, their posting and exchange to presidencies being arranged by the principal medical officer, under the orders of the Commander-in-Chief of that country. Hitherto the custom has been to detail the medical officer in this country, when placing him under orders for India, for the particular presidency in which he is to serve. The new Order has its advantages and disadvantages and the judgment in regard to it will no doubt be influenced by the effect it will have on the interests of the individual officers concerned respectively; but, on the whole, we believe that the change, which has been effected no doubt for service and departmental considerations in India, will not be generally popular. It opens the door to patronage and possible abuse, and it will certainly require to be honestly and judiciously worked. We have during the past year striven to keep our readers *au courant* with the progress of medical work and events in India and the Indian medical service. There is little to add in connexion with the events which have taken place in the past year in the Naval Medical Service, the members of which appear to be well satisfied with the rank and titles about which there has been so much discussion in the military services. It has been stated that the late Sir RICHARD OWEN served for a brief period as a midshipman in the Royal Navy; if so, the naval service may be said to share with the medical profession the loss of one of the most distinguished names in science of this age by his death, but that service with the rest of us may rejoice that in Professor HUXLEY they still possess an authority of the highest scientific reputation and distinguished also in the walks of philosophy, literature and general culture.

*Volunteer Service.*—The Volunteer Medical Service has during the past year materially improved in efficiency—rank having been more clearly defined, and the proficiency examination having been rendered compulsory within two years of

gaining a commission. These changes have tended to raise the standard of the service. With the view of assisting medical officers to pass the proficiency examination classes have been held several times during the year, under the auspices of the Volunteer Army Service Institute, which have been well attended and found to be very helpful. Greater interest has been taken in Bearer Company Drill and larger numbers of men from the various regiments have gone through courses of instruction and gained the Army Ambulance certificate. In every direction progress in the Volunteer Medical Service is evident. For the first time a number of decorations have been conferred upon this service and upon medical officers belonging to it.

#### *The General Medical Council.*

The General Medical Council held its two usual meetings. At the first the members sat five days—from May 24th to May 28th inclusive—and at the other (in November) only four days—from the 23rd to the 26th inclusive. It is obvious that the Council, though spending rather less time over its business of late years, has more and more responsible duties to discharge both to the public and the profession. The *personnel* of the Council has been altered by the lamented death of two of its distinguished members—Dr. GEORGE YEOMAN HEATH and Sir GEORGE MACLEOD. The former is replaced by Dr. PHILIPSON in the representation of the University of Durham and the latter by Dr. DAVID CALDWELL McVAIL in the representation of the Crown for Scotland. The University of Aberdeen has no longer for its representative Professor STRUTHERS, who laboured much and well in the service of the Council. On the expiration of his term of office Dr. ANGUS FRASER was elected in his place. One chief work of the Council was to appoint an Inspector and Visitors to report on the examinations of the various bodies. Some of these reports will come up for discussion at the meeting in May next. Questions of professional behaviour arose in several cases at both meetings. In the result the names of five practitioners were ordered to be erased from the Register, three for “infamous behaviour in a professional respect,” and two on the ground of having been convicted of felony. A very important motion by Sir JOHN SIMON, urging the duty of the examining bodies in the first instance to deal with irregular conduct in their diplomas, was properly postponed till the next meeting of the Council in consideration of the fact that the case which suggested his motion is the subject of appeal. At both meetings of the Council, in connexion with the complaints by the War Office of defective preliminary education in applicants for army medical appointments, the question of the examination in arts, held by the Apothecaries’ Society, was raised. It is not in evidence that this examination is specially to blame; but it is used as the portal to the profession by hundreds who do not take the Apothecaries licence. It is naturally objected that the *potestas clavium* of the profession conceded or delegated by other bodies to the educational authorities of the country should reside so largely at Blackfriars. The Apothecaries are tenacious of their old privilege, and the question is still the subject of somewhat unseemly difference between the Council and a body which depends on it for coöperation. On the unsatisfactory state of the law, especially in France and Switzerland, prohibiting English practitioners from

practising, even among their own compatriots, in those countries, the President (Sir RICHARD QUAIN) spoke strongly and explained that statements had been prepared of the state of English law, in accordance with the wishes of the Council, to be forwarded by the Foreign Office to countries concerned. At the November meeting an important memorial, signed by over a thousand practitioners, was presented to the Council on the subject of Medical Aid Associations from Dr. LESLIE PHILLIPS, representing the Medical Defence Union, complaining that the way in which such institutions are worked is injurious to the public and the profession alike. Counter-representations were made on behalf of the associations. In the end the Council resolved that the question should be investigated and for this purpose appointed a committee of six of its members “to fully sift the matter and report to the Council at its next session.” There is reason to hope that both the associations and their medical officers will assist the Council to come to a right judgment on this subject. The Council also determined at the November meeting to apply the regulation as to “covering” unqualified assistants to the case of registered dentists and to give them due notice, so that ignorance may not be successfully pleaded. Dr. RENTOUL presented a memorial complaining of the action of the Obstetric Societies and certain other parties in giving to women certificates which purported to be “qualifications” in midwifery, contrary to the spirit and letter of the law. The Council agreed to communicate with the bodies concerned and to advise them that such certificates should be expressed in language that would not convey the impression that they are legal qualifications to practise midwifery.

#### *The Proposed Teaching University for London.*

AT the close of the year 1891 the Draft Charter promoted by King’s and University Colleges and agreed to by the representatives of the London Medical Schools had been passed by the Lords of the Privy Council, and was awaiting the assembling of Parliament for its assent. Permission had been obtained before the meeting of Parliament for changing the name from the “Albert” University to that of the “Gresham,” and the Gresham Grand Committee had given the scheme their full support. But during the Parliamentary recess a very formidable opposition had arisen, and it became evident that the passing of the Charter was seriously imperilled. As soon as the medical schools of London had consented to become constituent Colleges in the new University the authorities of the Victoria University and the provincial schools of medicine assumed a hostile attitude to the movement and took every means to defeat the passing of the Charter, especially in the House of Commons. In spite of the protests and disclaimers of the deans of the London medical schools a statement was widely circulated to the effect that the new University was intentionally being established in order to lower the standard of medical degrees, and that this was sure to be brought about if the Senate contained such a large representation of the medical schools as was proposed in the Charter. We pointed out the unfairness and injustice of these statements, but they evidently considerably influenced the minds of the provincial members of Parliament, especially of those from the north of England and from the district around Birmingham. The opposition from the provinces was sup-

ported by many members of the Senate and Convocation of the University of London, by the authorities of Bedford College, the Birkbeck Institution and other similar bodies, whilst the University Extension Society agitated a much wider scheme for the education of non-collegiate students. Professor KARL PEARSON and some other professors in the Faculty of Science at University College actively urged the formation of a Professorial in opposition to a Federated University. On March 3rd a deputation representing these interests waited on Lord SALISBURY, at which Vice-Chancellor RENDALL and Mr. CHAMBERLAIN were the principal speakers, and it was soon apparent that the Government would give way to the Parliamentary opposition, although Lord SALISBURY pointed out that the objections then raised should have been placed before the Lords of the Privy Council, who would have duly inquired into their value. On March 9th the Draft Charter was remitted by Mr. BALFOUR for reconsideration and on April 25th a new Royal Commission was appointed "to consider and if they think fit alter and amend the proposed Charter remitted in compliance with an address of the House of Commons, so as to form and report to us a scheme for the establishment under Charter of an efficient Teaching University for London." The members of this Commission are Earl COWPER (the chairman), Lord REAY, Bishop BARRY, Lord PLAYFAIR, Vice-Chancellor RENDALL, Professors RAMSAY and SIDGWICK, Canon BROWN, Mr. ANSTIE, Q.C., and Mr. R. C. PALMER as representatives of the various lay interests concerned in the question; whilst medical education is represented by Sir W. S. SAVORY, Sir G. M. HUMPHRY and Professor BURDON-SANDERSON. London medical teachers who are not specially connected with the corporations, and the general medical practitioners who are vitally affected by changes in London medical education are conspicuously missing from the *personnel* of the Commission. The sittings began on May 21st and on the 28th the first witnesses were heard, and the proceedings are likely to run well into February before the evidence will be completed. A large number of persons have given lengthy and contradictory opinions as to what ought really to constitute a University in London, but all are in the main agreed that it should specially concern itself with University education in London and not be merely an Imperial Examining Board. If one University is to combine both functions it must delegate the duties specially pertaining to them to two separate committees of the Senate, and thus reconstitute itself into a two-sided University. The evidence of the medical witnesses called before the Commission was practically a restatement of that given before the former Commission, who fully recognised the medical side of the question and reported that the London medical student was suffering from a grave injustice and that steps to remedy the grievance ought to be taken. During the past month a correspondence in *The Times* has shown us that the supporters of the Professorial University are scarcely agreed as to what is the exact basis of their scheme. Professor HUXLEY wishes to retain the title and prestige of the University of London and to "federate" the technical schools as colleges of the University, whilst Professor PEARSON will not hear of a University with federated colleges, and has consequently resigned the secretaryship of the Association for promoting a Professorial University in

London. The new departure has the support of many of the scientific Fellows of the University of London and of the Professors at South Kensington, but will probably be strongly opposed in Convocation. We see no provision for meeting the medical difficulty in Professor HUXLEY's new scheme, which so far has only been shadowed forth in outline.

#### *British Medical Association.*

The sixtieth annual meeting of the British Medical Association was held at Nottingham on Tuesday, July 26th, and following days. The President of the year, succeeding Dr. ROBERTS THOMSON of Bournemouth, was Mr. JOSEPH WHITE, senior surgeon to the General Hospital, Nottingham. The meeting was characterised by a fairly good attendance of members and by the great variety of subjects treated. A noticeable event was a motion by Dr. S. H. GALTON to admit women to the membership of the Association and by its being carried without a dissentient voice. The addresses delivered were of much interest. In that of the PRESIDENT the advances of British medicine since the last meeting of the Association in Nottingham, thirty-five years ago, including Preventive Medicine and Surgery, was ably traced. The other addresses by presidents of sections, Dr. RANSOM, Mr. CROFT, Sir W. FOSTER, Mr. BEVAN LEWIS, Mr. VICTOR HORSLEY, Dr. MARSHALL, Dr. BROOKHOUSE and Dr. HAYES, were original and suggestive. Amongst the more noticeable features of the addresses was an attack by Mr. VICTOR HORSLEY on the too exclusively anatomical and post-mortem character of pathology as heretofore studied; also a needed protest by Dr. GAIRDNER of Glasgow against Touting in Medicine, or the tendency to take our therapeutics from what Americans call "the machine," without sufficient organisation for observation and report, by practitioners in all parts of the country. Amongst important discussions we may mention those on Liver Surgery, on Post-partum Hæmorrhage, on Tubal and Uterine Disease, on Psychoses after Influenza, on the Treatment of Dyspnœa, on the Treatment of Ringworm, on Therapeutics &c.

#### *The Church Congress.*

The public interest in medical subjects was excited by the Church Congress at Folkestone, where a discussion was raised on "anti-vivisection." This subject, or the way in which it was handled on both sides, seemed to displace and supersede all topics merely theological, and for weeks afterwards the sound of battle was in the air between those who view experiments on animals from a theoretical point of view and those who find themselves face to face with disease in the whole animal creation and whose mission it is to understand and to control it. Without defending all the expressions used we have no hesitation in saying that the cause of science and true humanity has been immensely strengthened by the discussion. It leaves, of course, many well-meaning people "of the same opinion still." But amongst men and women with any ordinary sense of proportion the case is established by overwhelming considerations for a careful and regulated use of the lower animals, wherever possible under conditions of anaesthesia, for the purpose of investigating the nature and processes of disease and the action of remedies.

#### *Hospital Mirror.*

The columns which we have devoted to the description and illustration of cases under the care and treatment of members

of the profession in our public hospitals and dispensaries throughout the world have been filled as usual with accounts of more than passing interest. We have continued the custom of making editorial comments on the cases as they have been brought forward from week to week, and have received letters expressive of the appreciation in which such remarks are held by our readers. In the review of a year's work done in this department we are, however, necessarily obliged to limit the extent of our selections and omit reference to many cases of importance. The value of saline injections into the veins in certain conditions is exemplified very strongly by the record of the cases of patients in whom it appeared probable that a fatal result would have ensued without its employment: a child aged nine months, in a state of collapse after long-continued vomiting and diarrhoea; a woman aged twenty-eight, who became collapsed with signs of internal hæmorrhage some hours after ovariectomy; a man aged twenty-eight, who had lost much blood as the result of a gunshot wound of the leg, on whom amputation was performed after the injection, and although another injection was afterwards required recovery ensued; a patient aged eighteen, who had lost much blood as the result of a deep burn extending to and implicating the popliteal artery, was enabled to undergo amputation and recovered; a railway shunter, who was much collapsed after crush of both legs, underwent a double amputation, and although the saline solution was not employed before the operation it was injected with great advantage before the patient was removed to bed. In two other instances it was also used, but the cases were more desperate and the patients ultimately died; one had received very extensive internal injuries, the other a burnt wound of the axilla from which hæmorrhage requiring ligature of the axillary artery occurred, this was followed by gangrene of the arm, secondary hæmorrhage ensuing at a later date, and the arm was amputated. Other cases of severe injury are described, notably one in which the patient had received a stab wound in the left loin through which the colon protruded, and a second in the practice of the same surgeon of a girl aged eighteen who had received a stab in the left side penetrating the pleural cavity and diaphragm, with protrusion of omentum through the chest wall. Both patients recovered. A case of fracture of the anterior inferior spine of the ilium from excessive muscular action in a man aged thirty-five is apparently an example of an injury hitherto unrecorded, but rests on the authority of a careful observer. Two cases of recovery after severe injuries to the spine are worthy of attention. A man aged thirty-eight whilst working in a tunnel was bent forwards between a heavy beam of timber and the ground, his body being in a sitting position. On admission there was complete paraplegia with much shock, loss of sensation as high as the seventh ribs in front, priapism and retention of urine; on the fourth day he had pains running down the inner side of the arms with girdle pains; on the sixth day a depression could be felt in the position of the second dorsal spine, and after reduction of this under chloroform recovery, gradually ensued. The catheter was required for six weeks, but no cystitis resulted. A year later the man could walk four miles with the aid of a stick. A man who had fallen into a chalk pit received a fracture of the second lumbar vertebra and was at first paraplegic and suffered

from retention, subsequently some improvement resulted, various muscles partially recovering and the patient regained power over the bladder. As the symptoms became stationary laminectomy was performed nine weeks after the injury with satisfactory results, for in a few weeks the patient could walk up and down stairs without any support; this is an example of the class of spinal injury in which the operation of laminectomy is specially indicated. Excision of the head of the femur was performed in the case of a boy aged eleven years; the head of the bone had been displaced between the layers of the abdominal wall and was lying midway between the umbilicus and pubes; below the latter reduction could not be effected. The amount of shortening immediately after the accident was three inches; after the operation (which did not permit of the femur being brought lower down) it amounted to two inches. The recovery of a patient from traumatic peritonitis with severe symptoms is recorded, also a case of complete rupture of the intestine, in which the history was misleading and the extent of the injury unsuspected until examination after death which was due to peritonitis. Few cases of bilateral empyema are on record. We have given particulars of two: in a child aged ten years the treatment was by resection of rib—first on the left and eleven days later on the right side; the collection on the right side was localised. In a child aged eighteen months the left side was treated by resection; on the twelfth day pus was found on the right side, but the child died a day later somewhat suddenly, before any further treatment could be carried out. We have published cases of abdominal section, for recurrent pelvic peritonitis (a most important series); for primary carcinoma of the kidney; for excision of malignant growth of cæcum, the faecal fistula which was formed in the first instance being subsequently cured by resection; for the performance of LORETA'S operation; for the removal of the uterus. A patient suffering from faecal fistula, the result of ulceration of the cæcum and perityphlitic abscess, was treated by lateral anastomosis of intestine, SENN'S bone plates being used; recovery was apparently complete in six weeks' time; the fistula was of six months' duration and had not improved after scraping &c. A recovery after excision of the vermiform appendix, which was found in a perityphlitic abscess, is described; the patient—a boy of twelve—had suffered with symptoms referable to the cæcum for ten days. As examples of more recent departures in surgery we may mention a case of trans-peritoneal ligature of the left external iliac artery for aneurysm occupying a high position in the inguinal region, the patient, aged thirty, making a satisfactory recovery; a case of thyroid grafting for myxœdema in which the graft appeared to live and the patient improved, but relapsed amid the less favourable surroundings of her own home; a case of open tenotomy of the structures occupying the popliteal space in old-standing contraction of the knee-joint, the good effect of this method, in certain cases, being clearly shown.

#### *The Medical Societies.*

In our annual retrospect of the work of the medical societies the increased demand on our space, in conjunction with the ever-increasing volume of the contributions, has compelled a rather different method of review. We have therefore, so far as practicable, gathered together under general and special headings the communications that have

been noticed without reference to the Societies which served as their birthplace. It has been found possible to refer to but a moiety of the many valuable essays that have been tendered; for the enlightening and critical discussions which have followed their production we must ask our readers to refer to the full reports which we have published from week to week. To observant students of the progress of the medical art these reports of themselves appeal eloquently as evidences of honest work. The activity displayed by those who, though engaged in the active practice of their profession, yet find time to place fully before their brethren the results of their labours at the bedside and in the laboratory can call for nothing but hearty commendation. The presidential address of Mr. HUTCHINSON at the Medical Society on Names, Definitions and Classifications in Disease is one that is worthy of being considered by both physicians and surgeons, for it abounds in practical hints on these subjects which are the outcome of a life experience. In the domain of Medicine the treatment of Hydatid of the Lung was fully discussed, the subject being introduced in a paper by Dr. ORD and Mr. ROBINSON. Again, later, it was dealt with in a paper by Dr. HECTOR MACKENZIE. Dr. GOODHART, in his admirable Harveian Lectures, dealt with the Common Neuroses, or the neurotic element in disease and its rational treatment. Dr. MITCHELL BRUCE and Mr. MARMADUKE SHEILD communicated a paper on Gelatiniform Degeneration of Hydatid Cysts, commenting on the rarity and the clinical importance of this occurrence. Dr. ARCHIBALD GARROD, in two papers on the Changes in the Blood in the course of Rheumatic Attacks, stated that in acute cases the red corpuscles diminished to the extent of about a million per cubic millimetre, the white corpuscles being increased. Dr. WALTER CARR, in a paper on Splenic Anæmia in Children, expressed his belief that the malady was due to a separate cachexia, to which both syphilis and rickets predisposed. Dr. BRISTOWE related some instructive cases of Hepatic Cirrhosis, in which a cure or subsidence of ascites took place, and he insisted on the fact that the efficacy of treatment depended largely on accuracy of diagnosis. The subject of Relapsing Appendicitis received additional attention and many valuable clinical cases were placed on record. Dr. F. J. WETHERED gave his opinion on the Diagnostic and Prognostic Value of Tubercle Bacilli in the Sputum. Dr. LAUDER BRUNTON discussed, from a physician's point of view, the Causation and Treatment of Hæmorrhoids and Allied Affections. Dr. RALFE dealt with the Treatment of Diabetes, dividing the confirmed diabetics into two classes—alimentary and general—and suggesting appropriate therapeutic measures for each. Attention was called by Dr. BURNEY YEO to the frequency with which Cardiac Asthenia followed on Influenza. Many other papers on the complications and sequelæ of this disease were produced. Dr. THIN made an important addition to our knowledge of the symptoms and pathology of Psilosis Linguae et Intestini. A communication on Renal Dropsy by Dr. DICKINSON elicited the current views of many of the foremost thinkers on this subject. The rarer complications of Rheumatoid Arthritis were dwelt on by Dr. KENT SPENDER, and Mr. HUGH LANE discussed the diagnosis of this affection from rheumatoid arthritis. The benefit following the Arsenical Treatment of a case of Leucocythæmia was set forth in a paper by Mr. DOUGLAS DREW. The treatment

of Pernicious Anæmia by Transfusion was advocated by Dr. BRAKENRIDGE and Dr. AFFLECK. Dr. B. W. RICHARDSON gave some interesting and curious details of a new method of Physical Diagnosis by Intra-thoracic Auscultation. An interesting sequel to a case of Tuberculous Peritonitis was placed on record by Mr. LAWFORD KNAGGS. Dr. W. B. HADDEN discussed the Bearings of Syphilis in respect of the Production of Nervous Diseases in Children. Dr. O'CARROLL related the clinical history of four cases of Cerebral Lead Poisoning. Dr. COLLIER pointed out the tendency of young Englishmen to indulge in athletic exercises to an extent likely to prove harmful and to cause Diseases of the Heart and Arteries. A valuable clinical communication on cases of Irregular Heart was furnished by Dr. SANSOM, who held that all forms and degrees of arrhythmia were to be ascribed to disturbances of the nervous mechanism of the heart. Dr. FRANCIS HAWKINS gave the results of a careful analysis of seventeen cases of Typhoid Fever associated with Hemiplegia.

The following were some of the Pathological subjects of interest which were brought forward: Mr. MORTON of Clifton directed attention to the subject of Tubercular Ulcer of the Tongue. The condition of the Breast Tissue in cases of Carcinoma was studied by Mr. RAYMOND JOHNSON and Mr. BEADLES, their results emphasising the necessity for complete removal of every vestige of the gland in cancer. Mr. KANTHACK gave a minute description of a case of Madura Foot. Dr. GRIFFITHS exhibited a Dermoid Cyst, probably originally ovarian, which was found attached to the great omentum. A thoughtful paper was read by Mr. SHATTOCK on the Inadequacy of the Current Terms applied to Suppuration and suggesting a new term. Dr. SIMS WOODHEAD introduced a discussion on Phagocytosis and Immunity, which excited much attention and brought out the latest views of many eminent pathological workers. Mr. HOWARD MARSII dealt with the subject of Senile Tuberculosis, and discussed its diagnosis from osteo-arthritis. Nine cases of Congenital Dislocation of the Radius were collected by Mr. F. C. ABBOTT, seven of them occurring in one family. Mr. JACKSON CLARKE showed a litter of five kittens, all of them with Congenital Malformation, and he gave evidence to show that this was due to the mechanical effects of an abdominal tumour in the dam. A specimen of Ileo-colic Intussusception caused by an inverted Meckel's diverticulum was exhibited by Mr. JAMES ADAMS, and another instance of Intussusception associated with Polypus was brought forward by Mr. LOCKWOOD. Dr. F. C. TURNER demonstrated Microscopic Changes in the Brains of Five Fatal Cases of Chorea. A case of Pedunculated Sarcoma of the Cerebellum was brought forward by Dr. M'WHEENY. Dr. ROLLESTON dealt with the subject of Fat Necrosis, regarding it as a trophic lesion resulting from spread of morbid change from the pancreas to the solar plexus. A specimen of Adenoma of the Soft Palate was brought forward by Mr. C. A. MORTON. Mr. W. ANDERSON claimed that he had found, in a specimen of Chronic Mastitis of the Male Breast, the missing link in the pathological analogies of the male and female mammae. At the last meeting of the Pathological Society a curious specimen of Renal Sarcoma growing down the Ureter was shown by Dr. PENROSE, and Mr. JACKSON CLARKE believed that he

had proved to demonstration the causative rôle played by psorosperms in the production of squamous epithelioma.

There were some valuable contributions to surgery. Professor WILLIAM ROSE, in his admirable Lettsomian Lectures, dealt fully with the treatment of Trigeminal Neuralgia from a surgical point of view, and illustrated his remarks with accounts of his own operative successes in these cases. Mr. BRUCE CLARKE advocated the Galvano-cautery for the radical cure of Prostatic Obstruction. Mr. BLAND SUTTON put on record a successful case of Trephining for Hæmorrhage from the Middle Meningeal Artery. He also related successful examples of operative interference in a case of impaction of gall-stones in the common bile-duct and in an instance of splenectomy for wandering spleen. Mr. BOWREMAN JESSETT gave the details of five cases of Gastro-enterostomy, and two of Jejunostomy for Malignant Disease. Mr. MORGAN showed a boy who had sustained a Compound Fracture of the Skull; the comminuted portions of bone were replaced and the patient made a good recovery. A case of Punctured Wound of the Thigh, involving both femoral artery and vein, recorded by Mr. H. ALLINGHAM, led to a discussion as to the proper primary treatment of such a case and the best time to amputate after gangrene supervened. Mr. W. G. MCPHERSON communicated the results of a useful research as to Antiseptic Preparations of Catgut and Silk and their relation to Wound Infection. He found that the most aseptic material sold was the fine undyed silk twist, untreated with any antiseptic material. Mr. GREIG SMITH, in a paper on Enterostomy in Intestinal Obstruction, described a novel method of treatment of the gut, and Mr. F. PAUL gave an account of a case of Enterectomy performed by a method of his own device. Cases of Pylorotomy and Jejunostomy were also brought forward by Mr. MAYO ROBSON, and Mr. A. LANE gave details of a case of Excision of a Cancerous Stricture of the Small Intestine. Mr. BARWELL communicated a paper on the Operative Treatment of Congenital Dislocation of the Hip. A contribution on Nerve Grafting by Mr. DAMER HARRISSON contained a review of the published cases in which this procedure had been carried out. A paper on some further cases illustrating Hepatic Surgery, from the pen of Mr. KNOWSLEY THORNTON, elicited an animated discussion. Mr. ARBUTHNOT LANE recommended a new method of Nephrorrhaphy by splitting the renal capsule posteriorly, twisting the portions stripped up and attaching them to sutures passed through the parietes. He also introduced another way of completely erasing the ankle-joint. Mr. LITTLEWOOD gave particulars of a successful case of Laparotomy for Traumatic Cyst of the Pancreas. Mr. HULKE later related a case of Pancreatic Cyst treated by Exploratory Laparotomy with a fatal result. Mr. GODLEE, in a paper on Ligature of the Left Subclavian Artery for the Cure of an Axillary Aneurysm, dealt with the justifiability of the operation, the best method of performing it and the best material for ligature. Mr. T. W. NUNN read a paper, in continuation of a previous communication, on Cubitus Valgus and Cubitus Varus arising from Fracture at the Elbow-joint. Mr. W. G. SPENCER advocated timely Amputation in Gangrene from Diabetes Mellitus as a means of prolonging life and reducing sugar excretion. Mr. GODLEE later read a paper on this subject, holding that the determining causes were the

same in diabetic as in other forms of gangrene. A case of Traumatic Aneurysm of the External Iliac Artery in a boy aged six was contributed by Mr. CLUTTON. Mr. G. R. TURNER related a case of Traumatic Volvulus of the Small Intestine successfully treated by early Abdominal Section. Mr. MBEREDITH summarised his experience as to the best way of treating the Peritoneum in Abdominal Surgery. Mr. BLAND SUTTON showed two cases of Amputation of the Arm for Lymphatic Œdema in cases of Cancer of the Breast, in which much comfort to the patient ensued. Mr. HOWSE advocated Amputation through the Thigh, either as a preliminary operation to, or in some cases instead of, amputation through the hip where the hip-joint itself was diseased and the patient in very bad condition. Mr. HULKE gave the details of a case of Hepatic Abscess which burst into the peritoneal sac and which was successfully treated by incision and flushing. Mr. EDMUND OWEN, for the radical treatment of severe Talipes Equino-varus in children, recommended the operation introduced by PHELPS of New York.

In the department of State Medicine and Public Health a thoughtful paper on the Causes of Famine and its relation to Disease was contributed by Sir WILLIAM MOORE. Dr. WILLS of Southwell, in a contribution on Occupation in its Relation to Health, made some sensible observations on the selection of employment for those predisposed to tubercle. Brigade-Surgeon PRINGLE gave his views as to what constituted efficient Vaccination, and Dr. S. M. COPEMAN made some interesting observations on the Bacteriology of Vaccine Lymph. Dr. SISLEY discussed the relation between Influenza in Man and Animals. Mr. C. F. CASSAL referred to the effects of boric acid on health when used as a preservative for food. Dr. COSGRAVE dealt with the subject of the Control of Inebriates. Inspector-General LAWSON read a paper on Cholera in Ships at Sea and their Connexion with Manifestations of the same Disease on Land; and Surgeon-Colonel HAMILTON also introduced a debate on its Epidemic Progression. The Seasonal Prevalence of Enteric Fever in London was the subject of a communication by Dr. LOUIS PARKIS. Dr. F. J. PAYNE, in his retiring address at the Epidemiological Society, took as his subject that of Tuberculosis as an Endemic Disease. The "clinical evenings" have been continued by the older societies and adopted by many others. They have been well attended and usually were abundantly supplied with cases for demonstration.

#### *Special Commissions and other Reports.*

*Sanitary.*—In the first issue of THE LANCET of this year we continued our investigation into the ventilation of theatres and other places of public assembly. The great amphitheatre of the new Sorbonne at Paris was selected to illustrate the most recent innovations. We had previously described how at the Vienna Opera House the principle of warming only a portion of the air and then mixing it with pure cold air before its admission had been adopted. At the Sorbonne the purer outside air may be supplied without any sort of warming. The entire wall space of the Sorbonne is previously heated and radiates warmth through the supply of incoming cold fresh air. As the cold air strikes the warm walls it is warmed, becomes lighter, expands and travels upwards. If, on the contrary, according to the old methods warmed air were admitted it would on striking the cold walls lose its heat,

contract, become heavier and fall as a cold draught on the heads of the people below. Our report and accompanying illustration show how these principles are practically applied. Subsequently in a report of the warming and ventilation of private dwellings we described the villa which M. SOMESCO, civil engineer, built for himself at Creil, near Paris, where the same principle is applied. In this case, the outer walls of the house are hollow. The "blanket" of air in the tubular walls is warmed by a furnace in the basement. This heat, passing through the inner wall, radiates across the dwelling-rooms, with the result that, even in cold winter weather, M. SOMESCO'S family sit with their windows wide open, breathing the fresh garden air, and this without suffering from cold or from draughts.

A special report on "Sanitation in the Shop" materially helped to rouse public attention to the abnormal conditions under which shop assistants have to work. The facts brought forward in our report were considered of such importance that our Commissioner was called before the Select Committee of the House of Commons on the Shop Hours Bill and the entire report of THE LANCET was reprinted in the Blue-book on this question. We pointed out the evils likely to result from standing behind a shop counter for fourteen hours a day, from sleeping in crowded attics above the shops and eating hurried meals in basements under the shops, and near unventilated, badly constructed drains. At the same time we showed that it was in the small rather than in the large shops that such evils would be found to prevail.

During the earlier part of the year we described at some length the French Workmen's Sanitary Congress, which was a notable effort of the organised working classes to grapple with the problems of public health in which they are most concerned. In this they received notable assistance from Dr. DUJARDIN-BEAUMETZ, Dr. HENRY NAPIAS, Dr. A. J. MARTIN and other leading sanitary reformers of France. In special articles on sanitation at Calais, and on the Dieppe and Harwich routes, we described the results of our researches as to the improvements effected in passenger communications with the Continent. As travelling abroad for recreation and for health becomes more and more general, this subject is of increasing practical importance. We were also the first to give the full authentic account of the Sanitary Conference held by the different European Powers at Venice and published the text of the protocol there adopted and which now governs the traffic through the Suez Canal, in respect to medical examinations, quarantines &c. During the controversy arising out of the pretended danger of importing cholera through the Suez Canal many complaints were made by foreign critics as to the slow progress of the sanitary measures the English Government is expected to adopt in India. It was therefore gratifying to be able to describe the very satisfactory drainage of the waterlogged town of Rangoon, which has been accomplished, in spite of topographical difficulties. But though the French Government was very anxious to take precautions against cholera at Suez it displayed neglect nearer home. While the cholera epidemic, failing altogether to avail itself of the Suez route, was travelling through Asia towards Russia, another and apparently a separate epidemic had already broken out in the suburbs of Paris. The true nature of this epidemic was revealed by our Special Correspondent. From the commence-

ment of July up to the present date we have published almost every week special articles describing the result of investigations made on the spot. A great many of these articles deal with Paris, the contamination of the Seine water, the measures taken to cope with the epidemic in the French capital and the conflicts between the various local sanitary authorities. The condition of Paris was of the greatest interest, as it was the centre—for a long time the unsuspected centre—from which the western extremity of Europe has been infected. The first case of cholera at Havre, on July 5th, came from Paris; the first cases at Antwerp, on August 15th, came from Havre; and at the same time in another part of Belgium, the first persons to suffer from cholera at Jumet were Belgian workmen who had just returned home from Sarcelles near Paris. Our Special Correspondent consequently went to study these facts on the spot, and reported on the insanitary conditions which favoured the spread of cholera at Jumet, Antwerp, Boom and other places. He also described the sanitary administration of Brussels and the quarantine station of the Scheldt at Doël. Subsequently he visited and examined the drainage, the water-supply, the housing of the poor, the methods of disinfection and other details bearing upon the prevalence of cholera throughout Normandy. We have thus been able to publish very complete accounts of what has occurred at Rouen, Havre, Caen, Trouville, Honfleur and Dieppe. With the aid of maps and diagrams the history of the epidemic in France and Belgium and the sanitary condition of some of the towns visited have been graphically illustrated. By thus carefully noting on the spot the conditions under which the epidemic in some instances developed rapidly, in others slightly and in some cases not at all, we may hope to have brought forward an array of facts that will help to solve the great problems at issue in regard to the prevalence and growth of cholera epidemics.

*Analytical.*—It is satisfactory to be able to report continued activity in this interesting department, in spite of a temporary suspension of operations which was necessary towards the end of the year in order to provide what has long been wanted—increased laboratory accommodation. The new laboratory, in fact, has only quite recently been finished, and it is now replete with all those modern apparatus, fittings and appliances which the carrying out of carefully conducted and accurate chemical analysis in all its branches now demands. As the improvements that have been effected are considerable we think it would be of interest to our readers to describe them somewhat in detail; and this we propose to do in our next issue, which will be the first number of THE LANCET of 1893. Our attention has again been engaged in the elucidation of the fog and smoke question, and considerable time was spent in the early spring in investigating a stove which was said, not only to consume its own smoke, but also to effect an important economy in the consumption of fuel. Our Analytical Commissioner conducted a series of interesting analyses in Bradford, Yorkshire, where the invention was in working order. Independent examination was subsequently made in THE LANCET Laboratory, and the entire analyses and results were embodied in our Second Report on Perfect Combustion and Smoke Prevention, in THE LANCET of March 5th. The actual coals used were examined, the products of combustion were

repeatedly analysed and the economical value of the system deduced. Some idea of the scientific work this entailed may be gathered from the fact that no less than fifty-five single analyses were published in the report. It is satisfactory to learn that quite recently this system has been favourably reported on by many leading chemists and engineers, and a large demand has since arisen for its widespread adoption.

We have added to our records another report upon mineral waters, temperance beverages &c., selecting this time as a type of temperance beverage Kop's Alc. This inquiry involved, as a reference to THE LANCET of May 21st will show, thirty-seven single determinations, which were made with the view principally of ascertaining how far the beverage could justly be regarded as of the non-intoxicating order. As a matter of fact it contained a minimum of alcohol, a negligible quantity,  $\frac{1}{3}$  per cent. by weight. Being submitted for a short time to a fermentative process it is made more closely to resemble ordinary beer, while as regards hop constituents it is even more strongly charged.

An interesting analysis (made in THE LANCET Laboratory) of the water of Hagar's Well at Mecca appeared in connexion with a paper on the Holy Places of Arabia, by Dr. WORLNET, in THE LANCET of May 14th. A similar analysis had been made in 1883. Referring to the previous sample the following interesting observation is made:—"Our recent analysis indicates that the putrefactive process is still going on, and it follows that the ingress of putrefiable substances into the water has again been permitted."

The next Analytical Commission was instituted to reinvestigate the subject of arsenical wall papers. The report appeared in THE LANCET of July 2nd. From the great number of examinations made we were in a position to state that, owing doubtless to the action of the medical profession in unanimously condemning the practice of employing arsenical colours in wall papers—an action in which THE LANCET took no small part—wall papers loaded with arsenical pigment have apparently become a thing of the past, and those containing any arsenic at all contained an almost imperceptible quantity, while others gave no response to a test which serves to detect the  $\frac{1}{10000}$  part of a grain.

In the same number of THE LANCET appeared an article on dangerous diabetic flours, in which two preparations in particular were shown to be absolutely pernicious as diabetic foods, containing over 62 and 66.6 per cent. of starch respectively, although both were advertised as mainly free from starch.

Lastly, under the heading of "Analytical Records from THE LANCET Laboratory," the total number of foods, drugs &c. reported upon amounted to 118, and the number of analyses made, exclusive of special commissions, was no less than 230. We have repeatedly had occasion, it should be remarked, to point out in our columns the unsatisfactory way in which the Food and Drugs Act is being worked in many districts owing to the unaccountable lethargy of the authorities. In several places and in one metropolitan district—St. Martin-in-the-Fields—not a single sample was procured for analysis during the official year. This we have deprecated in strong terms, and now that the Local Government Board have taken the matter in hand it is to be hoped that this state of things will be, as it needs to be, quickly remedied.

Meanwhile we hope to pursue with renewed vigour the work of this all-important department. We are in a better position to do so; the laboratory is now not only situated on THE LANCET premises, but it is fitted with all those appliances and modern improvements by which chemical investigation has been made more accurate and manipulation less laborious.

#### *Hospital Administration.*

The past year has not been marked by any changes of importance in the ordinary course of hospital administration beyond those which are regularly in progress, but it has been signalled by the appearance of the last volume of the report issued by the Committee of the House of Lords and the publication of the full results of that inquiry. It is much to be hoped that the inquiry will not fall to the ground, although it must be admitted that the difficulty of the subject dealt with has driven the Committee to make suggestions for the formation of a controlling body of so unusual a character that no surprise need be felt if extreme difficulty should be found in giving effect to them. It would have been comparatively easy to extend the jurisdiction of some existing Government department over these institutions, but this expedient has not been approved, and the Committee has very wisely decided that the less departmental control is brought to bear upon the work of hospitals the better. But the adoption of a principle like this, however sound, tends not to the solution but to the creation of a difficulty and the future must show whether or not the plan approved by the committee has in it the elements of successful work. Apart from the scheme of control the principal recommendation contained in the report is that relating to the foundation of a new hospital for the south of London—a recommendation for which much can be said on the ground of the needs of the district indicated, but which should be adopted only after an inquiry directed more pointedly to the matter in question. It may be admitted that the distribution of hospital accommodation in London, and especially south of the Thames, leaves much to be desired, and yet the proposal to correct this imperfection by the creation of a new institution to compete for the gifts of the charitable should be very jealously scanned and adopted only if in the end it should prove impossible to attain the desired result by any other means. At present therefore more is to be hoped than can be confidently predicated of the Committee's report—the great event, so far as Hospital Administration is concerned, of the past year.

#### *The Benevolent Agencies of the Profession.*

Notwithstanding an impression to the contrary, the attainment of success in our profession is not by any means a matter of course, and many are apt to be left at the end of their life's journey with inadequate provision for old age or for those whom they may leave behind them. The societies that are meant to mitigate the results of such a state of matters deserve all the help, and more, that they receive from successful practitioners. A great effort was made at the Biennial Dinner in April under the presidency of the Right Hon. (now Sir) DAVID EVANS, the Lord Mayor, in which we were glad to take our share, to increase the good done by the Medical Benevolent College by raising a sum that would enable the governors to remove the pensioners from the school to live amongst their friends and so to afford addi-

tional facilities in the College for the education of sons of medical men. THE LANCET Relief Fund established to assist members of the profession temporarily in need has been administered, as in former years, by the Presidents respectively of the Medical Council and of the two Royal Colleges in conjunction with ourselves. The Almoners in their report, published in the first number of THE LANCET of the present year, were able to place on record twenty-two cases of relief afforded, in every one of which a pressing and temporary need had been assuaged either by a gift or a timely loan, as the case required. The fourth annual report of the Fund and Forms of Application will be published in our next issue. The Medical Benevolent Fund and the Society for the Relief of Widows and Orphans of Medical Men continue their beneficent work. The latter society has constant occasion to regret that more members of the profession in the postal district of the metropolis do not take advantage of its benefits.

#### *Metropolitan Hospital Sunday Fund.*

The Metropolitan Hospital Sunday was held on June 19th, 1892. The sum obtained was less than in the previous year, but the number of contributing congregations is largely increased.

#### *Honours to Medical Men.*

The following is a list of the medical honours of the year:—Dr. GEORGE JOHNSON, Dr. FREDERIC BATEMAN, Dr. GEORGE BUCHANAN and Dr. P. C. SMYLY were made Knights. Dr. THORNE THORNE and Fleet-Surgeon MAHON, R.N., were made Companions of the Bath. Professor FLOWER was made a Knight Commander of the Bath. Surgeon-Major-General RICE and Surgeon-Major S. ROBINSON were made Companions of the Star of India. Surgeon-Captain HARE was made Companion of the Distinguished Service Order. Dr. A. OGSTON, Regius Professor of Surgery, was appointed Surgeon-in-Ordinary to the QUEEN in Scotland, and Sir WM. STOKES Surgeon-in-Ordinary to the QUEEN in Ireland. Dr. BROADBENT was appointed Physician-in-Ordinary to the Prince of WALES and Dr. WM. HICKMAN Physician-in-Ordinary to the Duke of EDINBURGH. Sir W. FOSTER, to the satisfaction of the profession, was appointed Parliamentary Secretary of the Local Government Board.

#### *Obituary.*

The obituary of the profession seems a very heavy one if we have respect to the many names of distinguished members of the profession which it contains. Many of these indeed died at a ripe age. Dr. JOHN McDONNELL, F.R.C.S.I., of Dublin, and pupil of the famous RICHARD CARMICHAEL, died at the age of ninety-six. Mr. ROBERT PHILIPSON EDGER, of Hetton-le-Hole, Durham, died aged ninety-four, having taken the Apothecaries' licence in 1823. Dr. GEORGE DIXON LONGSTAFF also died aged ninety-four, having been assistant to the celebrated Professor HOPE of Edinburgh. The lives of some of these long-lived members of the profession would prove worthy of the attention of Sir GEORGE HUMPHRY. Dr. W. F. CUMMING of the clan Cumming and of the Isle of Mull died aged eighty-seven; but it is fifty-six years since he left India and travelled to restore his health. Among many charming qualities and accomplishments he was a great angler. He angled till, from exposure to wet, he became paraplegic. But he went on fishing, having a contrivance for being carried down to the loch, and he still succeeded in catching as many salmon

as before. Highly related in Scotch society, he was appointed by the Duke of ARGYLL to be his private secretary in two Governments,—one that of Lord ABERDEEN, the other that of Lord PALMESTON. But we may not dwell on the great variety of character, service, and history of medical men, as we are tempted to do when once we begin to reflect on the lives whose termination it is our painful duty to record. The following are some of the names which have appeared in our obituary during the year 1892, out of a long list of which we are sorry to omit even one:—Professor JOHN WOOD, Professor BERKELEY HILL, Brigade-Surgeon F. R. WILSON, OSCAR CLAYTON, Sir GEORGE PAGET, ALFRED CARPENTER, Sir MORELL MACKENZIE, Dr. JAMES ROSS of Manchester, GEORGE YEOMAN HEATH, Sir WILLIAM BOWMAN, Dr. HENRY TOMKINS of Leicester, Mr. ESQUIRE DUKES of Canonbury, Dr. TRIPE of Hackney, Dr. D. HAYES AGNEW of Philadelphia, Mr. GEORGE HOGARTH MAKINS, Dr. PHILIP VANDERBYL, Mr. THOMAS COLLEY of Chester, Dr. WILLIAM COLLES (aged eighty-four, son of the celebrated ABRAHAM COLLES), Mr. JAMES PIESSE HARRIS of Liverpool (fifty years in practice), Sir WILLIAM AITKEN, M.D., Mr. FREDERICK LE GROS CLARK, Sir GEORGE MACLEOD, Dr. AITKEN of Inverness, Dr. CONWAY EVANS, Dr. HENRY JOHN TYLDEN, Mr. WALTER PYE of St. Mary's, Dr. KEILLER of Edinburgh, Mr. EDWARD COCK, J.P., F.R.C.S. Eng. (aged eighty-seven), Dr. GEORGE ROSS, Professor of Practical Physic in Montreal, Mr. ROBERT ZACCHERUS PITTS of Chelmsford, Mr. WILLIAM LINDOW DICKINSON of Workington (the first to note trichiniasis during life in this country), Inspector-General D. L. MORGAN, Sir RICHARD OWEN, Dr. WALSH, Dr. DARBISHIRE, Dr. AVELING, Surgeon-General FASSON (who was superintendent of the Edinburgh Royal Infirmary since his retirement from the Army Medical Service), Inspector-General R. TAYLOR, C.B., and, as we are going to press, Surgeon-Colonel GODWIN, the late Professor of Military Surgery at Netley, and others. We have noticed the extreme longevity of some of the lives of our colleagues. It is sad to note, on the other hand, the death of many young men struck down in the very middle of the battle of life or earlier—sometimes with typhoid fever, perhaps with influenza. The only comfort is that they have died at their posts and that in most instances they have left behind character and work that will be at once the inspiration and the example of their children and of those who survive them.

#### *Conclusion.*

We must now conclude our annual summary and may perhaps be permitted in so doing to express to our readers the seasonable wish of "A Happy New Year." We can conceive no profession capable of affording truer happiness than our own. Standard bearers fall, but the great army of healers and helpers remains fighting, not only against disease, but against all those conditions which produce it. Before the Annus Medicus of 1892 can be mastered in all its significance the duties of another year will begin to press on us. It is gratifying to believe, as we firmly do, that disease after disease is coming increasingly under the control of well-directed medical skill and service and that the very failures of the years that are gone are among the conditions of better success in those which are to come. There are still diseases which are the opprobrium of medicine, but not of medicine alone. Medicine has a right to demand the help of society,

of Legislatures, of all men of light and leading. It has been too much the fashion to leave medicine single-handed to cope with disease and the misery which accompanies it. But with more generous help and recognition, medicine will yet appear as a very angel of mercy and as a controlling force over the most appalling diseases.

## Annotations.

"Ne quid nims."

### THE QUEEN AND THE HOSPITALS.

It is no new thing for us to have to note the sympathy which Her Majesty always evinces for the distressed among her subjects. With her gracious sanction a facsimile of the letter which she addressed to the nation in response to the widely expressed and respectful sympathy of her people on the occasion of the lamented death of the Duke of Clarence and Avondale has been largely distributed among the in-patients of hospitals throughout the kingdom. If we may be permitted to paraphrase the highest title which a Sovereign can bear, we make bold to say that that which will spring most readily from the hearts of her English subjects as applicable to Her Majesty, and designating at once her kindly interest and the homage of a grateful people, will be the proud title "Mater patriæ."

### OPERATION FOR JACKSONIAN EPILEPSY.

IN the last number of the *International Journal of the Medical Sciences* Dr. Alexander B. Shaw, of St. Louis, records a curious and interesting case, in which operation was undertaken on the brain for the purpose of relieving epileptic attacks beginning in the right arm and sometimes being limited to that limb. The patient was a married woman of thirty-one, the mother of several children. There was nothing in her previous history—either syphilis or injury—to suggest a cause for the fits. The first attack came on in March 1890, without any warning. Its character is not described, but the patient lost consciousness, and remained unconscious for some time. During the next six months the attacks recurred about every two months. They then became more frequent, in spite of treatment, until March, 1891, when she was having an attack about once in every three or four days, the majority being mild and unaccompanied by loss of consciousness, but a certain proportion were more severe and rendered the patient unconscious. During the first few months all the attacks were preceded by a feeling of numbness or pricking, or both, commencing in the right hand and spreading up the arm. This was followed by jerking of the arm, which would sometimes terminate the seizure. Usually, however, forced extension of the toes followed and jerking of the right lower limb. Sometimes the attack went no further; frequently general convulsion succeeded, with unconsciousness and conjugate deviation of the head and eyes to the right. Just before the operation in December, 1891, there was marked weakness on the right side of the body, involving the face, arm and leg, which was greater after a fit. There was also impairment of memory, but no mention is made of any affection of speech, which we should have expected to be present, at least after the seizures. Both visual fields were limited, but apparently optic neuritis was not present. There is said to have been anæmia of the right disc. Trephining was performed over the arm area, and considerable difficulty was experienced in removing the button of bone on account of a considerable thickening of the skull throughout two-thirds of the circumference of the opening. This thickening was

greatest over the arm centre in the ascending frontal convolution. The opening was enlarged with forceps and the brain was found to bulge very considerably. After opening the dura mater the cortex was found to be much altered and its consistence was such as to suggest the presence of fluid. None was found on tapping, however, but the surface was irrigated with sterilised water and it then became lighter and more natural in colour. The wound healed well, and since the operation the patient has remained free from pain in the arm and there has been no spasm or convulsion, local or general, and although there is absolute loss of power in the right arm, the facial deformity has disappeared, there is less difficulty in getting about and the patient's memory is better. The result of the operation must be regarded as satisfactory. The further progress will be interesting, especially if it clears up the diagnosis. From the facts ascertained it seems as if the condition of the bone had been the means of altering the cortex and giving rise to the convulsions.

### THE LATE SIR RICHARD OWEN.

A PRELIMINARY meeting was held on Wednesday afternoon at the house of Sir James Paget, with the view to the promotion of a memorial to commemorate the late Sir Richard Owen's services to science. It was resolved to form a committee to carry out the object, upon which the following among others have already consented to serve: The Presidents of the Royal Colleges of Physicians and Surgeons and of most of the scientific societies, the Duke of Teck, Lord Playfair, Professor Huxley, Sir Joseph Hooker, Sir Henry Acland, Sir John Evans, Dr. Michael Foster, Mr. Sclater, Sir W. Savory, Mr. Hulke, Sir Joseph Fayrer, Sir Edward Fry, Dr. Günther, Mr. Carruthers and Dr. H. Woodward. Sir William Flower will act as treasurer, and a general meeting will be called at an early date in the rooms of the Royal Society. It was suggested that the memorial should be a marble statue, to be placed in the hall of the Natural History Museum.

### THE HEALTH OF ITALY.

THE year closes for the Italian peninsula with an exceptionally clean bill of health and with a no less favourable prospect for the year to come. The President of the Council of State has just received from the Senator, Professor Moleschott, the customary report, setting forth, on the authority of the "Consiglio Superiore di Sanità," the health statistics of the country, with the conclusions to which they lead up. With the one exception of pellagra—a local disease, due to an entirely preventable cause, the consumption of unsound grain—no malady on an epidemic scale has for months been met with in the peninsula; while sporadic ailments themselves appear in reduced number and intensity. To the report thus satisfactorily made by Professor Moleschott confirmation has been given by the "Scuola d'Igiene," which, from a special and independent standpoint, reviews the sanitary state of the kingdom and embodies its judgment in official form. These gratifying announcements become still more acceptable when the causes of the improved health conditions of Italy are taken into account. These are mainly the increased activity of the officers of State hygiene, the wider diffusion of sound sanitary knowledge among the population and the greater efficiency of medical practice in the provinces. Italy is thus seen to be on the right tack and to be already reaping her reward, and not only will the physical and moral well-being of her people be the gainer from this enforcement and observance, public and private, of sound sanitary law, but material advantages will also be hers from the freer, less apprehensive influx of foreign residents into her cities and provinces—a source, as she herself admits, from which about one-third of her yearly income is drawn. From Her Majesty Queen Victoria to the most modest of personally conducted

tourists next season will witness a larger number of visitors to Italy, her winter cities and her "sun-traps," than she has hitherto calculated on, and it will be her own fault if successive seasons do not register a steady advance on their immediate predecessors, till the residence of the invalid or convalescent within her borders becomes as safe and as unvarying a proceeding as that on the French Riviera or even at our own familiar health resorts.

#### THE PREVALENCE OF SMALL-POX.

If any change has taken place in the prevalence of small-pox it is in the direction of the widening of the area of distribution. Much anxiety is felt as regards Manchester, for with an increasing amount of small-pox and an increase in the number of districts affected the accommodation available at Monsall is becoming exhausted. This matter was some time since the subject of a carefully compiled report by Dr. Tatham and the occurrence in question may expedite action on the lines which he so ably advocated. The Corporation are, in the meantime, being pressed by the Manchester and Salford Sanitary Association, the members of which have acquired the reputation of supporting every properly devised scheme for the protection of health in the two boroughs concerned. Between 40 and 50 attacks have occurred in Manchester during the present month. In Barnsley the disease is spreading—6 cases were reported last week and removals to the Kendray infectious hospital are increasing; in Halifax a fresh extension has taken place—some 30 patients were in the small-pox hospital and 9 fresh attacks were recorded last week; cases have occurred at Lancaster; a considerable outbreak is reported from West Halton, in the Brigg rural district, Lincolnshire; in Chadderton and Oldham combined there were 20 new cases last week, 11 in Liverpool, 4 in Rotherham, 4 in Southampton, 3 in Derby and minor outbreaks in a number of other places; 6 cases are in hospital in Edinburgh. In the Metropolitan Asylums Board ships 38 cases are under isolation and 7 fresh cases were reported last week.

#### CHRISTMAS INCIDENTS.

THE oft-repeated saying that in point of weather and in every other way the character of Christmas is changing is true only in a limited sense. Change and evolution must of course rule in this, as in all other times and things, but their processes are never revolutionary. We are not justified, therefore, in speaking even of the present rigorous weather as old-fashioned any more than we can ignore the freshness in maturity which marks the continuance of the season's ancient customs. Merry and bright as usual has been the Christmas of 1892 and we would willingly set our eyes on this aspect of it and look at no other. A sharp and timely frost, which came as if by appointment, has dressed the earth with winter's jewelled robe and has fixed with a wholesome chill the air laden with moisture-bred miasmata. It is true that fog, that spectral oppressor of our cities, has not spared us; nevertheless we have occasionally seen the moon and stars by night and even the metropolis has caught a glimmering half-smile of sunshine by day. This year thence on ponds and streams has been formed suddenly and with a deceptive appearance of solidity. It has tempted many, the more in consequence of the general holiday, to venture upon it when a very little reflection should have convinced them of its uncertain quality. Already the number of ice accidents is unusually large and these have repeatedly happened in spite of the plainest warnings. We are pleased to learn that at all events the ice on all ornamental waters under the control of the London County Council is being jealously guarded from such misuse until the fact of its bearing is beyond dispute. We need hardly impress upon every local authority, public or private, the wisdom and the duty of exercising a like restraint

upon the rashness of careless and inexperienced persons, as well as of maintaining for use in case of need the ordinary rescue and restorative appliances. There is no possibility of forgetting that the great winter festival has a social side. It is the common meeting point of every class. Its appeals to each are based upon the same sanctions of faith and of human kinship. Its usages, likewise, however they may be modified by circumstances, whether affluent or straitened, partake of the same essential characteristics. In the practice of these the rich and the poor meet together, and it is not, in our opinion, a subject of regret that even the poorest may enjoy some remembrance of his neighbour's charity. We are not indeed of those who would pamper with superfluous delicacies and expensive efforts at entertaining the inmates of workhouses, hospitals and the like institutions. There is too great a tendency perhaps to this kind of practice in our days. Nevertheless it must be admitted that all are the better for recognising in some substantial way the claims of poverty to participate in the universal enjoyment, and it were false economy to deny the occupants of hospital or workhouse an extra ounce of tobacco or of tea when their wealthier neighbours have enough and to spare. Excess of a somewhat serious character is unfortunately so far a constant circumstance in Christmas-keeping, and the case of a man recently found frozen to death while apparently lying in a drunken sleep is not by any means unique. The habit of "treating" with drink is happily falling more and more into disuse and its general discontinuance will cause no regret to any person who thoughtfully considers the matter. The incident just mentioned, however, may be remembered by the police and others as proving that even the drunken at this season may require, even if undeserving, some further care besides mere incarceration.

#### THE ALTHORP MURDER.

ON Dec. 24th at the Northampton Assizes Andrew McRae, a married man, was found guilty of having murdered a single woman named Annie Pritchard on July 20th last. The case is remarkable, firstly, from the ghastly circumstances surrounding the crime and, secondly, that the three essential facts to be established to validate a conviction—viz. (1) identification of the remains, (2) the proof of violent death and (3) the fixing the murder upon the accused—were all contested by counsel for the defence. It will be remembered that the greater part of the body of an adult female was found in a sack at East Haddon by the side of the railway. The woman Pritchard was proved to have been on terms of intimacy with McRae and it was also known that she had been delivered of a child. Some portions of incinerated bones were found in the fireplace at the warehouse where McRae was employed, and these, in the opinion of Mr. Milligan, belonged to a human being. In this he was supported by Mr. T. Bond, with the reservation that they bore a great resemblance to the phalanges of apes. There can be little doubt that the remains found at East Haddon were those of Pritchard, since some of the clothing was identified as having belonged to her. Further, McRae about the time of the disappearance of Pritchard purchased some lime. Another link in the chain of evidence consisted in the fact that the sack in which the remains were found bore a mark similar to others used in the warehouse before referred to. Again there was nothing but a suggestion to the effect that Pritchard was still alive. Moreover, McRae was proved to have occupied rooms with a woman corresponding to the description of Pritchard; in fact, the prisoner's counsel admitted they were known to each other, but contended that McRae had only given the woman shelter. It was further contended that there was no evidence that the person whose body was found at East Haddon had not died a natural death. The theories put

forward by McRae's counsel, although plausible, signally failed to cover the facts which had transpired and the jury had no alternative but to convict McRae. Mr. Justice Kennedy passed sentence of death.

#### HINDOO OCULISTS IN LONDON.

At the Marylebone Police Court, on the 21st inst., three Hindoo gentlemen—Molla Bux, Nabre Bux and Shah Deen—of 39, Camden-road, appeared, charged with pretending to be doctors of medicine or physicians. They practised as Indian oculists and distributed handbills in which Molla Bux was designated "Dr." Mr. W. T. B. Woods prosecuted on behalf of the London and Counties Medical Protection Society. The theory of the defence was that Molla Bux was an Indian oculist, that Nabre was his assistant and Deen his clerk, but the prosecution alleged that occasionally the two latter would lead persons to believe that they were "Dr. Molla Bux." Mr. Warburton adopted a bold line of defence. He admitted the facts and maintained that they amounted to no violation of the law. A certificate in Hindustani was put in and translated to the following effect: ["Dr. Molla Bux was practising for diseases of the eye and had given satisfaction to persons in the locality." This qualified him to practice in India. It seems a slight basis for a similar claim in England. But on his agreeing to use the word "Mr." Molla Bux instead of "Dr." and to avoid all pretension to being "registered," the summonses were dismissed.

#### THE SCHOOL BOARD AND THE VESTRIES.

THE important inquiry before Mr. Horace Smith at Clerkenwell Police-court on the sanitary state of the Yerbury Schools, where sixty-six of the scholars are said to have had diphtheria this year, was again adjourned. At the second sitting Mr. Harris, medical officer of health, was further examined, and described the tests he had applied to the drains and the soil—"made" soil—in which they were laid with joints left open, permitting leakage of sewage-water into the ground and foul air, gases, and emanations to make their way under the school premises and up through the thin and porous asphalt of the playground. His evidence was confirmed by that of Mr. James Patten Barber, surveyor to the Islington Vestry, by Professor Corfield, and by Mr. de Courcy, surveyor to the Hornsey Local Board. The magistrate undertook, at the request of the counsel for the board, to see the drains. The board maintains that the drains are no worse than others laid fifteen years ago. It is obvious that the Vestry of Islington is only doing its duty in having the real state of the drains thoroughly investigated. It would, perhaps, have been well if the medical officers of the respective authorities could have agreed without such an inquiry; but failing this it must have a good effect on the public and on responsible bodies to set all facts in the open light of a court of law. We have still to hear the evidence of the "other side."

#### MISMANAGEMENT OF MORTUARIES.

THERE are some honorary offices which men will strive after, and the duties of which they will undertake and discharge with readiness and perseverance; there are others which they accept because a public necessity is laid upon them and of which they will be quit at the earliest opportunity. As regards the great majority of mankind, it may be truly said that the functions of jury service belong to this latter class. Any pretext of business or of health is eagerly grasped at as a straw which may bear up one who is threatened with this fate. What is true of the juryman in an ordinary law case is probably true in a sensibly greater degree of one who has to use his judgment in aid of a coroner's decision. Obviously therefore it is at least highly impolitic to add by any avoidable annoyance to this never very palatable service,

Such an absence of ordinary care and we may say of ordinary civility as was apparent at a recent inquest in the Camberwell district was by no means calculated to improve the temper either of the coroner or his assessors. In this case it was impossible to view the body till the mortuary door, which was found to be locked, had been opened. In order to effect this object the St. Saviour's Board of Works had to be applied to, the jury going in procession for the key. It was noted also that though post-mortem examinations were conducted here, not even a piece of soap was provided for the use of those who performed them. This neglect of ordinary measures of cleanliness in connexion with inquest arrangements is not unknown in other parishes besides Camberwell. One want in particular is common and it is one which will be cruelly felt at the present time—namely, hot water. We need not remind our readers of the paramount importance of cleanliness in medical practice. The matter has been mentioned times without number in our columns and we must again protest against the unfairness of subjecting medical men and others to such annoyances as these, which might be most easily remedied, but which are still from sheer neglect suffered to remain as they now are—the causes of serious inconvenience, and even of injury, to the public health. There should be no difficulty in providing a coroner's officer with a key for any mortuary, or in making such provision as is absolutely needful for the wants of practitioners whose duties take them thither.

#### DEATH OF SURGEON-COLONEL C. H. Y. GODWIN, A.M.S.

It is with sincere regret that we record the death of Surgeon-Colonel C. H. Y. Godwin, whose decease will be widely deplored throughout the Army Medical Staff, where his eminent scientific attainments were highly appreciated. The news reached this country by telegram on Saturday last, he having died on the previous day, the 23rd inst., at Rawal Pindi, where he was principal medical officer of the division. He had only been in India three months when he was attacked with acute dysentery, which proved fatal in less than a fortnight. The circumstances under which he went to India will be fresh in the minds of our readers. On the resignation by Sir Thomas Longmore of the chair of military surgery at the Army Medical School, Netley, Brigade-Surgeon-Lieutenant-Colonel Godwin, who had acted in the capacity of assistant professor, succeeded Sir Thomas Longmore as professor. He had not long occupied that position when he was promoted to the rank of surgeon-colonel, but in consequence of some difficulty with the Treasury authorities regarding his pay, he was obliged to resign his chair of surgery. Thereupon he was ordered to India, and he had not been two months in that country when he was attacked, as we have said, with acute dysentery, which proved fatal in less than a fortnight.

#### SOME EFFECTS OF WOUNDS OF THE HEART.

SCIENCE, notwithstanding its usually strict obedience to law, surprises the observer of its processes not infrequently with some curious departure from its regular methods. To the by-law which decrees this occasional variation the science of pathology conforms and by many apparent freaks of diverse causation varies the processes by which disease more usually reveals itself. One such was the subject of an inquest at the Lambeth coroner's court a few days ago. The deceased, a female school teacher, died of pericarditis, and this condition was found on examination to be due to the presence of a needle which had penetrated the cardiac apex. The motive of course was suicide and the chosen method surely was a painful one enough. A very similar case was related at a meeting of the Royal Academy of Medicine in Ireland by Mr. William Thomson (THE LANCET, March 24th

1888). In this instance the sufferer was a lunatic and the cause of his fatal illness a pin which had been pushed up to its head in the fifth left intercostal space. It is hardly needful to observe that death in such cases does not occur suddenly, but what is more noteworthy is the fact that even where a considerable wound, such as that of a knife-stab, has been inflicted in the heart, the vital functions of that organ may continue for some time afterwards. A note in THE LANCET of Dec. 15th, 1888, bears upon this subject; and a still more striking illustration of the same fact is recorded in the Transactions of the Æsculapian Society for 1884. This latter example is further interesting as an instance of traumatic mitral murmur. The relatively late occurrence of death in such cases has an evident connexion with the obliquity and the size of the wound inflicted, or, in other words, with the suddenness and amount of the resulting hæmorrhage.

#### "A FILTHY AND POISONOUS RITE."

A FORTNIGHT since we drew attention to the unbiased testimony of a Roman Catholic priest to the efficacy of vaccination based on his personal powers of observation exercised in the performance of his self-sacrificing and Christian duty. To-day—in strange contrast with that experience—we are confronted with the *ex cathedra* utterance of a member of another profession, one from whom we might expect a judicial estimate of the subject. To be sure this gentleman has not—like the good priest—himself come into contact with small-pox patients; he has not seen the ravages it creates among the unvaccinated and the vast amount of suffering and death it inflicts upon unprotected children. His strong remarks are purely based on *a priori* considerations, on violent mistrust of the medical profession, as well as on the ground of interference with the liberty of the subject. He talks of the "medical despotism" which imposes the "filthy and poisonous rite" of vaccination upon a subservient nation, and he informs the world that "some of the noblest" of our ranks are on the side of anti-vaccination. It is, perhaps mere waste of time and energy to meet this effusion in the way it deserves, but we would ask Mr. Hopwood, Recorder of Liverpool, one plain question. Does he believe that the medical profession advocate vaccination and re-vaccination in their own interests or in those of the community whom they serve? There can only be one answer to that question, but it is not the one which fits in with the terms of the letter which has led to these remarks.

#### ACTINOMYCOSIS OF THE SPINE.

WITHIN the last two or three years a large number of cases of actinomycosis have been placed on record. The spinal column, as the seat of the primary disease, however, is very rare, and the following case, recorded in the *Münchener Medicinische Wochenschrift*, No. 25, 1892, is worthy of notice. The patient was a girl aged sixteen. For a long time the diagnosis remained uncertain, for from the family's clinical history tuberculosis was suspected. The primary symptoms pointed to the spine or posterior portions of the ribs as the seat of disease. It was considered probable that the spine was first attacked and that the morbid process then spread to the ribs and pleura, producing an acute and extensive pleuritis on the left side with a large amount of effusion. The inflammation then extended further up the spine and the pus penetrated between the intercostal muscles and the costal pleura, at first slowly and then more rapidly. At the same time the left lung was gradually invaded. The lung tissue then commenced to break down and a small abscess formed which finally burst into the bronchi. An examination of the sputum about this time cleared up the diagnosis, for the "ray fungus" was found and thus once more proved the value of such an examination in cases where the diagnosis is doubtful. Now that the examination of expectorated matters and discharges

from the chest is becoming more systematic cases of this kind will probably become much more numerous. To return to the account of this case: The pus extending on the left side finally penetrated the pericardium, leading to a sharp attack of pericarditis, followed by death. Although careful search was made no metastatic deposits were found in the other organs of the body.

#### EPIDEMIC INFLUENZA.

TOGETHER with the news as to a recurrence of epidemic influenza in Southern Russia and notably in Kieff, Odessa, Kherson and Nicolnieff, and with the announcement of attacks further north, as in Moscow, we are having unmistakable signs that we still have to do with the disease in this country for another winter. In Sheffield a number of people have been attacked, isolated occurrences are reported from other places, and the metropolis is by no means free. We may hope that this is the last manifestation of an epidemic which is on the wane before its final disappearance. It is highly improbable, however, that it will attain to anything like the dimensions of its previous outbreaks.

#### A WORKSHOP IN ST. JAMES'S.

THE St. James's Vestry had resolved to make a sudden visit to a tailor's cellar workshop. This place was represented as being twelve feet below the pavement, with a window looking out on to the area, which, however, is said to be so hemmed in that it was almost impossible to see the sky. The room was triangular and contained a number of gas-jets and a stove for heating the tailors' irons. It is supposed to be overcrowded and badly ventilated. The curious part of this matter is the energy with which a vestryman complained against the entrance of the sanitary inspector in this workshop; and when the vestry decided to go there themselves to verify the statements made, he wished to give the shopkeeper timely warning. Much yet remains to be done before the Amended Factory Act will be thoroughly applied and its principles realised. In the West-end generally, as well as in the sweaters' dens of Whitechapel, there are numerous workshops where the worst conditions prevail and where the health of the workers is gravely compromised. Our investigations in respect to sweating among tailors showed that even in some of the best workshops where there is no sweating and very good wages are paid there is often no ventilation, insufficient light and overcrowding. We are glad to see that the majority, in any case, of the St. James's vestry are quite disposed to take measures to put an end to such grievances.

#### MUSCULAR ATROPHY AND HEMIPLEGIA.

MESSRS. JAFFRAY AND ACHARD, in the *Archives de Médecine Expérimentale et d'Anatomie Pathologique*, have contributed some observations and made an attempt to reconcile the different theories which have been held with reference to the occurrence of atrophy after hemiplegia. This condition, according to Charcot and Leyden and their followers, is a result of an affection of the anterior horns in the spinal cord. Déjérine, on the other hand, ascribes the condition to an affection of the peripheral nerves; while Quincke, Eisenlohr, Babinski and others hold that there is no discoverable anatomical condition underlying the change, but that it is the result of a functional disturbance in the cells. In two cases examined by Messrs. Jaffray and Achard changes were found in the anterior horn cells, so far confirming Charcot's views. To explain the different conditions and reconcile the different theories, they suppose that in the first place, on account of the lesion of the pyramidal tracts, there is stimulation of the cells of the anterior horns, giving rise to contracture. If this stimulation is succeeded by exhaustion then

atrophy results, but in this there are several stages. At first there is simple muscular atrophy, the nerves not yet being appreciably altered, and the anterior horns and intramuscular endings being anatomically intact. But later degeneration in the motor nerves sets in, and in the peripheral nerve endings; and last of all, the cells in the anterior horns undergo visible atrophy.

#### ISOLATION ARRANGEMENTS FOR LEITH.

THE authorities of Leith are contemplating the erection of a new hospital for infectious diseases, and with this object in view a deputation, consisting of the provost, a number of councillors, with the burgh architect and Dr. Gray, the health officer, have recently conferred with Dr., Thorne Thorne and Mr. Power at the Local Government Board offices. They decided to visit one of the Metropolitan Asylums Board Hospitals, the hospital belonging to Leamington and Warwick and the one at Walker erected by the Corporation of Newcastle-upon-Tyne on their return journey.

ON the 22nd inst. certain changes took place at the Coombe Lying-in Hospital, Dublin, by which Dr. S. R. Mason, late master of the hospital, was appointed consulting surgeon, and Mr. P. P. Barry, L.R.C.P.I., L.R.C.S.I., late assistant to the master, was appointed deputy-master.

A MEMORIAL TABLET has recently been unveiled in the portico of the Ducal Palace at Mantua in honour of Dr. Achille Sacchi, whose romantic career as Garibaldian surgeon in Italy's wars of independence, followed by many years of philanthropic activity as practitioner and as citizen among the poor of the Venetian territory, has already been narrated in THE LANCET (April 12th, 1890).

MR. H. N. MILTON, medical officer of the Kasr-el-Aini Hospital at Cairo, some time since obtained a verdict against the French journal, *Le Bosphore Egyptien* on account of a violent article which it contained making certain allegations against English practitioners in Egypt. The judgment in the first instance awarded £1000 damages, but on appeal the amount was reduced to £80.

AT a meeting of the Governors of St. Mungo's College, Glasgow, held on Thursday, Dec. 22nd, Mr. Robert Thomas Kent, M.A., F.R.C.S., was appointed Professor of Anatomy in room of Mr. Henry E. Clark, M.R.C.S., who had been appointed Professor of Systematic Surgery, and Dr. Robert Fullarton was elected Lecturer on Diseases of the Throat and Nose, vice Dr. David Newman, resigned.

WE have to announce with regret the death of Inspector-General J. R. Taylor, C.B., F.R.C.S. Eng., of the Army Medical Department, and Honorary Surgeon to the Queen, at the age of eighty-two. This officer joined the medical service nearly sixty years ago, in May, 1833, and retired in 1863. He had seen much active service in the Crimea and elsewhere and was in receipt of a distinguished service reward.

THE post of medical superintendent of the now London County Asylum at Claybury has been filled by the appointment of Robert Jones, M.D. Lond., B.S., F.R.C.S. Eng. & Co. lately superintendent and resident physician of Earlswood Asylum. The contributions of Dr. Jones to alienist literature have been both numerous and important, whilst his official work in connexion with the asylums at Colney Hatch and Earlswood, and as an adviser on the best methods of asylum construction, mark him out as eminently fitted for the important post to which he has been elected.

MR. WALTER A. PRICE, aged twenty-four, a fourth year's student of the Bristol Royal Infirmary, was taken ill, while on duty as dresser for the week, on Dec. 8th with lymphangitis of the arm and after a few days developed cellulitis and died in that institution on the morning of Dec. 15th. A memorial service was held in the infirmary chapel on Saturday, Dec. 17th, which was attended by the members of the honorary staff, the resident medical officers and a large number of nurses, students and patients.

THE *London Gazette* of Tuesday last publishes an important notice calling attention to the clause in the Factory and Workshop Acts by which the Home Secretary is empowered to certify that in his opinion certain processes in the manufacture of earthenware explosives in which di-nitro-benzole is used and in conducting chemical works and quarries are dangerous or injurious to health. To carry out this provision the chief inspector may serve on the occupier of the factory or workshop a notice in writing, either proposing such special rules or requiring the adoption of such measures as may appear to the inspector to be efficient and practicable.

THE history of the healing art will shortly be enriched with an important contribution from the pen of the Senator Antonio de Martini, Professor of Medicine in the University of Naples. Dr. De Martini's subject is the Discovery of the Circulation of the Blood, and the proofs he has already given of proficiency in the historical aspects of medicine, coupled with his long association with an acknowledged master in those studies—Dr. de Renzis, the editor and translator of Celsus and historian of the Salernitan school—afford ample grounds for expecting from him an able and independent review of one of the greatest, while also the most gradual, of all discoveries in biology.

#### M. PASTEUR'S JUBILEE.

(FROM OUR SPECIAL CORRESPONDENT.)

THE seventieth anniversary of the birth of the illustrious *savant*, Louis Pasteur, was celebrated on Dec. 27th, in a style worthy of the great occasion. From the early hour of 9.30 A.M. streams of admirers began to pour into the large amphitheatre of the Sorbonne, the headquarters of the University of France having been aptly chosen as the scene of the ceremony, which no one present is ever likely to forget. The floor of the amphitheatre was reserved for deputations, both native and foreign, and for personages attending in an official capacity. The public filled the rest of the places, one of the "tribunes" being occupied by the band of the Garde Républicaine, another in the centre by Madame Carnot and one to the left by Madame Pasteur and members of her family. At 10.30 A.M. M. Pasteur entered, leaning on the arm of M. Carnot, the chief of the State. M. Pasteur wore evening dress, the sombreness of the costume being relieved by the addition of the scarf of the Grand Cross of the Legion of Honour. When the applause that greeted their entry had subsided, M. Carnot took the chair, while M. Pasteur seated himself at the far end of the first row of *fauteuils* by the side of his son, M. Jean Baptiste Pasteur, and behind a table destined to bear the weight of the piles of addresses and gifts sent from all parts of the world. To the right of the President were noticed MM. d'Abbadie, President of the Académie des Sciences; Le Royer, President of the Senate; Ribot, President of the Council; together with the Corps Diplomatique, our own Ambassador, the Marquis of Dufferin and Ava, being of the number. On M. Carnot's left were MM. Joseph Bertrand, Permanent Secretary of the Académie des Sciences; Floquet, President of the Chamber of Deputies; Dupuy, Minister of Public Instruction; and the rest of the Ministry *au grand complet*. Behind this first row the platform was occupied by deputations of the five divisions composing the Institute, of several foreign

societies, of the Académie de Médecine, and by M. Gréard, Vice-Rector of the Académie de Paris, the Deans of Faculties, the Presidents of the Cour de Cassation, Cour d'Appel and Conseil d'Etat, the Procureur-Général, the Prefects of the Seine and of Police, the President of the Municipal Council, the Director of the Assistance Publique &c. The semicircle of seats on the floor of the theatre was filled by deputations of the Association Générale des Etudiants (several members of which acted as ushers), the École Normale Supérieure, the École Polytechnique, a great number of French and foreign universities and societies, internes of Paris hospitals and members of the Institut. The first speaker was the Minister of Public Instruction, who, addressing first the President, characterised the gathering thus honoured by his (M. Carnot's) presence as "la fête de la France et de l'humanité," seeing that at that moment the thoughts of the entire scientific world and of thinking humanity were centred on what was passing at the old Sorbonne. Addressing, then, M. Pasteur as "cher et illustré maître," he said that, although his life-work could only be analysed by the scientific, the ignorant and the learned alike knew that he had accomplished *quelque chose de grand*; the most profane amongst us could not remain insensible to the results of his labours—labours conducted with so much patience and tenacity as to command the admiration of the world. All his success was due to his unswerving faith in science—"foi d'apôtre," as the orator termed it. Had he devoted his energies to pure science the topmost place would have been his. Happily for himself and for humanity he deserted that path and henceforth passed his days in inventing antidotes for diseases that had for centuries decimated both the animal and human populations. M. Dupuy here quoted Renan, who, addressing M. Pasteur on the occasion of his (Pasteur's) reception at the Académie Française, said: "Votre vie scientifique est comme une traînée lumineuse dans la grande nuit de l'infiniment petit, dans ces derniers abîmes de l'être où naît la vie." Agricultural France was fully aware of the debt of gratitude owing to him for his great discoveries made since the year 1860 on the principles of fermentation and their application to wine making, the manufacture of vinogard and brewing. Ever marching onward, he had aspired to the solution of such mysteries as the cause of diseases affecting the lower animals. Having given to farmers a vaccine for anthrax and swine typhoid, he had achieved the same success with hydrophobia. Henceforth, thanks to him, the following formula may be unhesitatingly accepted as true: "Ferments and viruses are living beings, vaccines are attenuated viruses and the basis of medicine is the artificial attenuation of viruses." In a magnificent peroration the Minister wound up his discourse by saluting M. Pasteur—that *merveille de la science et miracle du génie*—in the name of France and of humanity.

M. d'Abbadie, President of the Académie des Sciences, then congratulated M. Pasteur on behalf of the Institute and presented him with a splendid gold medal, the product of an international subscription. The medal, the work of M. Rotz, of the Académie des Beaux-Arts, bears on one side the effigy of M. Pasteur and on the other the following inscription: "À Pasteur, le jour de ses soixante-dix ans, la science et l'humanité reconnaissantes.—27 décembre, 1892." With the medal there was also presented a list of subscribers' names. Speeches by MM. Joseph Bertrand and Daubrée, of the Institute, were also delivered.

Sir Joseph Lister gave expression to the feelings of gratitude which animated the breasts of all practitioners of the healing art, and handed M. Pasteur a letter sent by the President of the Royal Society. Sir Joseph Lister said that he had the great honour of laying before him the homage of medicine and surgery. To no other man were the medical sciences so indebted as to M. Pasteur. His researches on fermentation had shed such a light on surgery as to transform the treatment of wounds from the too frequently disastrous empiricism which formerly obtained into a successful scientific method. Thanks to M. Pasteur, surgery had undergone a complete revolution, which had deprived it of its terrors and widened almost to an unlimited extent its usefulness. Nor was medicine less indebted to his profound and philosophical studies, which have lifted the veil which had covered for ages infectious diseases. M. Pasteur discovered and demonstrated their microbian origin. Thanks to his own special labours and to that of his pupils, the causation of quite a number of maladies is now revealed—

Felix qui potuit rerum cognoscere causas.

This knowledge has already facilitated to a remarkable extent the diagnosis of these plagues of humanity and in-

dicated the path to follow for their prophylactic and curative treatment. Along that path his grand discovery of the attenuation and intensifying of viruses would ever remain as a guiding star. As a striking example, Sir Joseph Lister mentioned Pasteur's researches on hydrophobia. With the exception of a few ignorant people, everyone appreciates the greatness of the results obtained by the application of his original method against this disease. M. Pasteur had furnished us with a means of diagnosis which unerringly dissipated all the horrible doubts which formerly haunted persons bitten by a healthy dog suspected to be rabid. Had he achieved no other triumph, this diagnostic one alone would entitle him to the eternal gratitude of mankind. But he had gone further, and by his marvellous anti-rabic inoculations he had been enabled to pursue the poison after its entrance into the system and vanquish it there. In conclusion, Sir Joseph Lister reminded M. Pasteur that of the diseases to which human beings were subject, those of an infectious nature were by far the most common. It was therefore only fitting that the medical and surgical branches of the profession should on that solemn occasion offer him their tribute of respect, admiration and profound gratitude.

Other speeches followed by M. Bergeron, on behalf of the Académie de Médecine, and M. Santon, President of the Paris Municipal Council. Then followed the presentation to M. Pasteur of addresses brought by delegates of various French and foreign societies. The names were called in alphabetical order, the foreign list being as follows:—Medical Society of Amsterdam, University of Athens, University of Barcelona, Medical Societies of Berlin, Berne, Brussels and Christiania, Health Association of Cologne, Academy of Sciences of Copenhagen (this latter sent a gold medal), Royal University of Ireland and Royal Academy of Medicine of Dublin, Faculties of Medicine of Gand and Geneva, Universities of Genoa, Lausanne, Liège, Association for the Advancement of Medicine of London, Medical Society of Lund, Institute of Medicine and Association of Sciences of St. Petersburg, Naturalists' Societies of Little Russia, Universities of Posen and Stockholm, Academy of Medicine of Turin, University of Utrecht and Medical Society of Warsaw. Besides these bodies, French ones were, as may be imagined, well to the fore in their congratulations. M. Ruffier, the Mayor of Dôle, M. Pasteur's native town, then delivered an address and offered to his distinguished fellow townsman an album containing an exact facsimile of the certificate of birth and the photograph of the house where he was born on Dec. 27th, 1822.

During this long series of presentations M. Pasteur was greatly moved, tears rolling down his cheeks on several occasions. So moved was he by the warmth of his reception that on rising to speak he could only utter a few broken sentences. The rest of his speech was read by his son. The presence of the President of the Republic, he said, transformed a *fête intime* into a *grande fête*, and thus the simple birthday of a *savant* became an epoch for French science. But in this joyful hour his thoughts involuntarily strayed to the hard struggles of searchers after truth, whose ideas had been stifled by the prejudice against which they had had to struggle. Not many years ago a man he had so loved and admired—Claude Bernard—had for a laboratory in the neighbouring Collège de France no more appropriate place than a low damp cellar. May he not have there contracted the disease which killed him? He could not refrain from contrasting the splendour of this reception with the above *souvenir* of his dead friend. "Je salue cette grande mémoire." It seemed that by a delicate attention his friends had tried to recall before his eyes the panorama of his life. The Mayor of Dôle brought him the photograph of the very humble house where his father and mother lived and struggled for existence. The presence of the pupils of the École Normale reminded him of the dawn of his enthusiasm for scientific research, as did that of the representatives of the Lille Faculty of his first studies in crystallography and fermentation—studies which revealed to him quite a new world. All his hearers knew how he had been led to pursue physiological investigations. If he had from time to time disturbed the calm usually reigning in the Académies by somewhat lively discussions, he did so because he was upholding the truth. Addressing the foreign section of his audience, M. Pasteur said: "You delegates of foreign nations who have journeyed so far to give a proof of your sympathy for France, you bring me the greatest joy a man can feel who believes that science and peace will triumph over

ignorance and warfare, that nations will end by understanding each other to their mutual edification, and that the future will belong to those who shall have done the most for suffering humanity. For the truth of this I appeal to you, my dear Lister, and to you all, illustrious representatives of science, medicine and surgery." Addressing his younger auditors, he said: "Young men, young men! trust to these sure, powerful methods only the primary secrets of which we are yet acquainted with; and whatever your path in life may be, keep clear of sterile and slanderous scepticism. Do not be discouraged by the sadness of certain epochs which it is the lot of every nation to pass through. Live in the serene peacefulness of laboratories and libraries. Ask yourselves, 'What have I done to educate myself?' Then, after having made some progress, ask yourselves the further question, 'What have I done for my country?' The time will then perhaps come when you may enjoy the immense delight of contemplating the benefits you have shed on progress and the good of humanity by having contributed to their progress. But let your efforts be successful or not, you should be in a position to say, 'I have done my best.'" I reproduce the closing sentence of M. Pasteur's discourse:—"Messieurs, je vous exprime ma profonde émotion et ma vive reconnaissance. De même que sur le revers de cette médaille, Roty, le grand artiste, a caché sous des roses la date si lourde qui pèse sur ma vie, de même vous avez voulu, mes chers confrères, donner à ma vieillesse le spectacle qui pouvait la réjouir davantage, celui de cette jeunesse si vivante et si aimante." The English delegates present were: Drs. Sidney Martin, Sims Woodhead, Cartwright-Wood, Armand Ruffer, Professor Burdon-Sanderson, Sir J. Paget, Sir T. Spencer Wells, Sir Joseph Lister and Sir Henry Roscoe.

## CHOLERA.

### CURRENT NOTES, COMMENTS AND CRITICISM.

THE continued appearance of cases of cholera over such a wide area in Russia, Poland, Germany and France sufficiently indicates the extent of distribution of the disease and naturally gives rise to disquieting apprehensions as to the probability of its still further extension and manifestation in epidemic force during next year. The cold weather—and it appears to have been extremely cold of late in Northern Europe and on the Continent generally—has no doubt greatly checked, but it has not destroyed, the disease.

The official statistics recently published at Berlin show that 8510 persons have died of cholera in Germany during the epidemic. In the city and State of Hamburg, where it prevailed most severely, the deaths were 7614, equal to about 1·22 per cent. of the population. The number of deaths in Prussia was 892, of which 502 occurred in the Government district of Schleswig, 116 in Lüneburg, 90 in Stade, 66 in Stettin, 42 in Potsdam, 16 in Magdeburg and 15 within the precincts of Berlin. The disease prevailed also in other German States to a relatively small extent. Mecklenburg-Schwerin, for example, which appears to have suffered most, had 43 deaths and the remaining States had a cholera mortality varying from 12 to 1 only. The statistics show that the epidemic attacked the districts near Hamburg most severely and spread up the river with diminishing force. Altona, in immediate proximity to Hamburg, had 328 deaths. The parts of the districts of Stade and Lüneburg, which lie on the left bank of the Elbe, also suffered severely for some time during the Hamburg epidemic. The town and subdistrict of Harburg had 102 deaths, 61 of which occurred at Wilhelmsburg, which has 8666 inhabitants. During the past week there have been almost daily several fresh cases of cholera at Hamburg. On the 27th inst. 4 fresh cases and 2 deaths were reported, and there were in addition 7 persons suffering from suspected cholera. There were a severe frost and dense fog at Hamburg on that date. Two fresh cases and one death from cholera were reported on the 28th.

From St. Petersburg we learn that cholera continued to prevail in the Vassili Ostroff quarter of that city and the disease is stated to have been very prevalent along the Caucasian shore. The Black Sea ports are officially reported to be free from cholera. According to a telegram from St. Petersburg on the 25th inst. no fresh cases of cholera had

been registered there during the past two days. The cold was intense, the thermometer registering 30° F. below zero. A large medical congress had assembled in that city to consider what means should be adopted in the event of the re-appearance of epidemic cholera in the spring and summer of 1893. There were 250 Russian doctors present at the preliminary meeting on the 25th inst., under the presidency of the Director of the Medical Department of the Minister of the Interior. In the south-western provinces of Russian Poland the disease was still prevailing severely according to telegraphic intelligence from Cracow.

There has been no further information as to the continued prevalence of cholera at Budapest. As regards France several cases of the disease have been recorded at Dunkirk—four cases and two deaths were reported as late as the 27th inst. Madame Joséphine Graffin, known as Sister Véronique, died last week from cholera at the Calais Hospital, where she had devoted herself to the nursing of cholera patients. Sister Véronique had only been in Calais one month, having come from Chartres. This death has caused some sensation and a public funeral attended by all the municipal authorities was given her. One of the male cholera patients in the hospital also died on the same day. At Paris there has been one death from cholera on Dec. 11th, 13th and 17th respectively, and a woman from the suburb of Noyent-sur-Marne died in a Paris Hospital on the 13th of the month. Five deaths among adults attributed to diarrhoea also occurred during the same week. We cannot be certain as to whether sporadic cases of cholera continue to make their appearance or not in other parts of France in the absence of any official or definite information on the subject, but the disease has presumably ceased there.

One of the remarkable and significant peculiarities of cholera has been frequently exhibited during the progress of the present epidemic. We allude to the localisation of the disease, its persistent adherence to places, districts, streets or individual houses. The occurrence of more than one case or of several cases in succession in the same house or locality, and sometimes with considerable intervals of time between them, has been frequently noticed. It was from observing this that the Indian practice of immediately evacuating an infected house or locality was adopted and followed with such success in that country. Low-lying sites, moisture, proximity to rivers and the outfall of sewers, and overcrowding of houses or population have also been influential factors in the incidence and spread of the disease, and as regards its importation it has frequently happened on searching investigation that cholera which was said to have been imported into a place at a given date has turned out to have been already there.

We are anxious to possess more particulars as to the results of the various bacteriological observations that have been made during the progress of the epidemic. So far as is known up to the present time the comma bacillus is practically confined to the intestine; it is rarely found in the vomited matters; it is not present in the blood or in the different tissues and organs of the body generally. Cholera discharges are *sui generis*; they are not found in any other disease and are distinctive of cholera, and it therefore requires to be shown that the bacillus is not merely a concomitant, but the cause of that condition; for, notwithstanding all that has been said on the subject, it has not yet been satisfactorily determined that the lower animals on inoculation with the bacillus manifest the same conditions or the same morbid phenomena that characterise cholera in man.

## CHOLERA IN FRANCE.

(FROM OUR SPECIAL CORRESPONDENT.)

### A VISIT TO DIEPPE.

*Cholera during the Bathing Season.—Severe Cases.—The Tide and the Subsoil.—How Gutters should be Flushed.—Contaminated Water of the Port.*

THERE are few towns on the French coast better known to Englishmen than Dieppe. More than 100,000 passengers, the vast majority of whom are English, pass through Dieppe annually on their way to or from Paris; also, as Dieppe is a most attractive sea-bathing summer resort, a great number of persons of all nationalities, but principally American, English and French, spend some portion of the summer

in this gay and attractive town. The sanitary condition of Dieppe is therefore of more than local interest, and this is particularly the case now that events have unfortunately shown that the town has not been free from cholera. This summer, while Dieppe was still crowded with fashionable visitors, the cholera broke out. The first case occurred on Aug. 17th, and Dr. Allemand, the "Doctor for Epidemics," failed to find any evidence tending to show that the case was imported. The victim was a woman, suffering from organic disease, who could not go out of her house and therefore had not been travelling. The second and third cases were reported on Aug. 22nd and 24th. There seemed to be no connexion between these three cases, they occurred in different quarters of the town, and the patients were unacquainted with each other. In the third case, the death was very sudden, and there could be no doubt as to the true Asiatic character of the cholera. So serious were the symptoms that two days later, on August 26th, a special service was organised to cope with the epidemic that was probably at hand. The ordinary patients were removed from the west wing of the town hospital, and the pavilion, consisting of two floors, was at once converted into a cholera hospital. On the first floor there are three rooms—one was allotted to men, the other to women, and the third was utilised as an observation room for doubtful cases. All the provisions for the cholera wards were passed in by the window, and great care was taken to isolate this part of the hospital. But one case occurred, and this in a manner for which the authorities can scarcely be held responsible. The patients were not allowed to receive visits from the members of their families. There was a special mortuary room for cholera cases, and burial generally took place two or three hours after death. All soiled linen was soaked in a solution of sulphate of copper for several hours. The dejecta and vomit were mixed with chloride of lime and buried in the garden of the hospital. All clothing was burnt till a stove for disinfecting by steam, super-heated under pressure, was obtained. The nurses were forced to change clothes and wash their hands on leaving the dormitories; 85 serious cases were treated in the hospital and there were 51 deaths; then 11 men and 19 women died in the town. In all 123 cases of cholera were reported to the Mayor, and Dr. Allemand is under the impression that there were altogether 80 deaths. On the other hand, at the Ministry of the Interior, only 69 deaths had been reported, but before full reports reach headquarters there is some delay. In any case, as Dieppe is but a small town with a population of 23,050 inhabitants, the epidemic was serious, though the facts were well concealed from the public at large. It was serious not only by reason of the number of cases, but because of their severity. Out of 48 deaths observed at the hospital 32 occurred within six to twenty-four hours after the admission of the patients. Four patients died in less than six hours, 15 in less than twelve hours and 4 in less than eighteen hours. There were also at the hospital 10 cases brought in from neighbouring districts outside Dieppe and only 4 recovered. The slight discrepancies in these figures do not affect the main features of the epidemic. In all these cases premonitory diarrhoea was very rarely observed. The patients had no pulse but a "fishy, dark, glutinous skin" and seemed to die of asphyxia. The total suppression of urine was very frequent and was treated by the administration of benzoate of caffeine. It is important to note that no case of illness among infants less than two years old was reported as cholera, however similar the symptoms might have been. The Mayor was at once informed of every case of cholera, and when the patient's room was evacuated it was disinfected by the burning of sulphur in the proportion of 50 grammes per cubic metre of space. Cases of contagion in members of the same family seemed clearly established, but there was no evidence to show that there was contagion in districts. In one case father, mother and child all had cholera one after the other and the child alone survived. Everything in this house was burnt by order of the Mayor. There were several cases of the wife or of the husband dying the one shortly after the other, but there was nothing to show that the cholera was conveyed from district to district; it seemed to spring up spontaneously in various directions. For instance, the first case happened at the outskirts of the town, to the south of the Berny Dock beyond the town railway station. The second case was at Le Pollet, the small and poor district on the eastern side of the port. These two first cases therefore were about as far apart from each other as is possible without overstepping the boundaries

of the town. Then a number of cases occurred on the other side of the port, in the narrow streets of the old sailors' quarter immediately behind the station in the tidal, where the passengers from Newhaven land. There were also cases at the cattle market. Thus the cholera broke out at the southern, the eastern, the northern and the western extremities of the town. Nor were the central districts exempt. The poor, the badly lodged, the intemperate were the principal sufferers, but there were others also who contracted the disease and who were neither poor nor intemperate. Then, when the cholera ceased, it was immediately followed by a small epidemic of typhoid fever. There were 24 cases and 4 deaths. Ten cases occurred in the town and 14 in the hospital. Four patients contracted typhoid fever and some of the hospital nurses, Sisters of Mercy and washerwomen also suffered. The latter cases were attributed, not to any special contagion, but to special susceptibility induced by the great strain and fatigue endured during the cholera epidemic.

As Dieppe enjoys the reputation of being a very healthy town, many persons will be surprised to hear that it has suffered, comparatively speaking, so severely. Though the cholera has broken out in a great number of places, there have been but few victims, excepting at Havre. Consequently the number of cases and of deaths at Dieppe compares unfavourably with the many other towns that have had but slight visitations of cholera. Yet Dieppe has a good water-supply, a good air supply and a soil not likely to be easily contaminated. By a good air-supply I mean that the town is constantly swept by strong sea winds which should purify its streets. A great part of the town faces the beach and the beach faces the north-west. By an ingenious diagram in the accompanying map the direction of the winds is indicated for the four seasons of the year. It will be seen that the prevailing winds drive up the Channel from the west, the south-west and south. On the other hand, the north-east, east and south-easterly winds, which are the land winds, are of rare occurrence.

The water-supply of Dieppe dates back several centuries, when an aqueduct was constructed to St. Aubin and brought a large quantity of water to a reservoir at the foot of Dieppe Castle; but eight years ago another and supplementary aqueduct was built, together with a much larger reservoir.

The water obtained is hard, but free from organic impurity, excepting in the autumn. The reservoir is not covered over and at that season a certain number of falling leaves are blown into the water and vegetable decomposition ensues. No evil has yet been traced to this exposure to dust and leaves; nevertheless the necessity of covering the reservoir is not only admitted, but the work is actually in hand, the expense is provided for and the reservoir will be properly covered over before next spring. For the higher quarters of the town there are two reservoirs on the heights or cliffs that are on both sides of Dieppe. They are both covered over with masonry and grass. No cattle are allowed to graze over the reservoirs and the grass is only utilised to make hay.

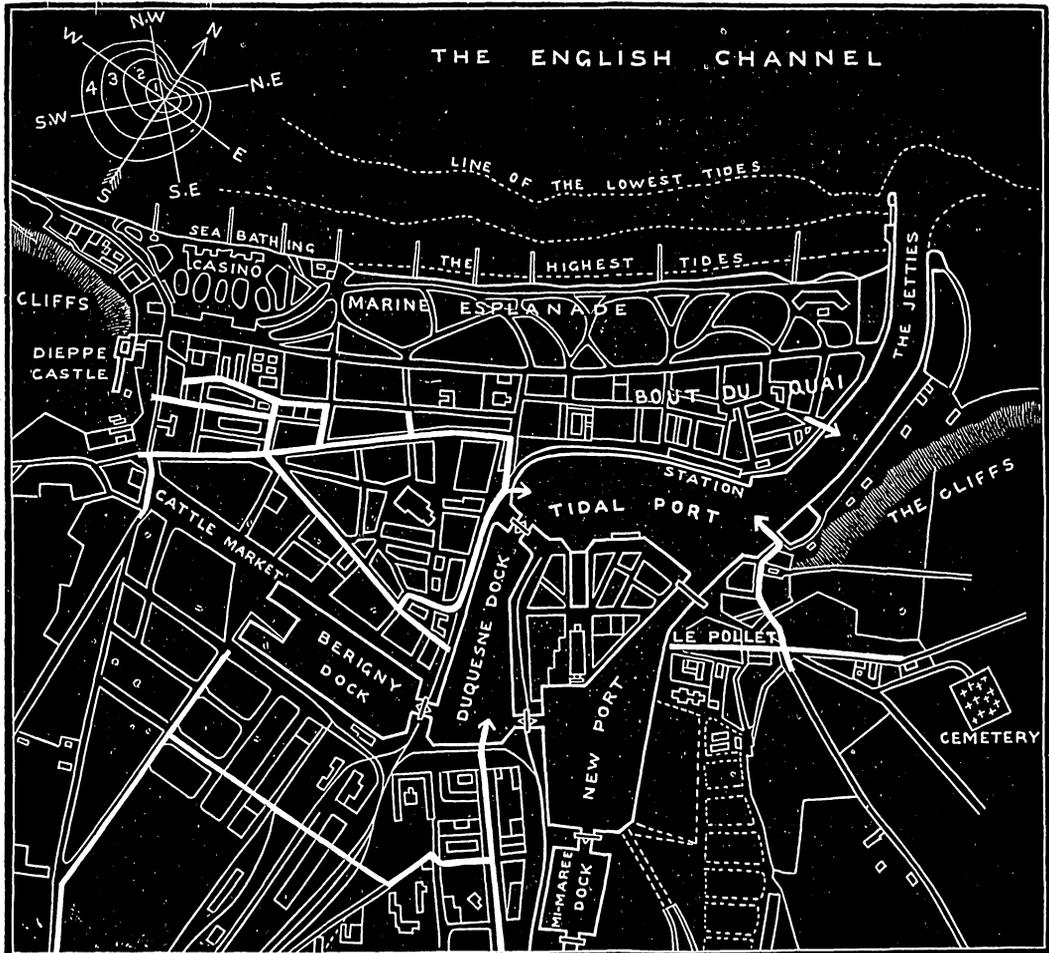

Dieppe is situated between two ranges of cliffs, each some eighty metres high. The name of the town is derived from the English word "deep." When Normandy belonged to England it was known as the "deep port," and some nine centuries ago the sea went about four miles further inland up the valley of the Arques. As the sea receded it left behind flint pebbles and these, mixed with clay brought down by the river Arques, formed the soil on which the town of Dieppe now stands. The sea tide can still run up between these flint stones and this should be a great advantage from a sanitary point of view. First, it compelled the inhabitants of Dieppe to build an aqueduct long before the importance of a pure water-supply was fully appreciated, because all the water in the wells was brackish; secondly, the tide working its way backwards and forwards below ground must help to drain and purify the subsoil. We have already seen how at Havre, in the Perret district, where the subsoil is washed by the tide in a similar manner, there was less typhoid fever and less cholera than in other quarters of the same town where no such purifying force exists. In respect therefore to its air-supply, its water-supply and the nature of its subsoil, Dieppe is especially fortunate. Why, then, has this town suffered more than so many of its neighbours? Certainly Dieppe was more exposed to the risk of contagion than most of its neighbours, but there is no evidence, at least with regard to the first cases, to show that they were due to contagion. Nevertheless there were any number of Parisians at Dieppe, and if the

cholera can be brought from one town to another town by travellers, then for several months Dieppe was daily exposed to this danger. If, however, in respect to the air, the water and the subsoil, Dieppe enjoys special advantages, the old quarters of the town are dirty, the houses high, overcrowded, and the inhabitants poor. A great number of these houses date from 1694, when the combined Dutch and English fleets bombarded and in a great measure destroyed Dieppe. The town was then rebuilt and, in those days, the knowledge of domestic sanitation was very limited. Most of the houses have no proper closets. I was assured, on good authority, that four-fifths of the population have *tinettes*, that is to say a large wooden tub placed in a cupboard generally at the top of the house. There are three or four companies, that undertake to remove these tubs or pails

into the flint subsoil and the sea tide carries their contents away. These *bétoires* are generally twenty-five to thirty feet deep, but in course of time they become so choked up that they cease to be porous. They then have to be emptied in the ordinary way, and men go down and scrape the sides to render them porous again. Thus only one-fifth of the houses have cesspools and only one-quarter of these cesspools are water-tight, and therefore do not contaminate the surrounding subsoil.

The slop or kitchen water of the houses at Dieppe, as is the case in most towns of Normandy, drains into the street gutters, and from thence into such sewers as exist. But before reaching the sewers it has here, as elsewhere, many opportunities of sinking into the ground and of helping to befoul the subsoil. Formerly most

DIEPPE

The broadest white lines indicate the sewers and the arrow-heads the sewer outfalls. The diagram indicates the direction of the winds during each of the four seasons of the year. In the original diagram, of which this is a proportionate reduction, every millimetre represented three days of wind.

and convert the contents into guano; but it is left to the choice of the inhabitants whether they give notice or not when their pails are full. A great many poor people seek to avoid the expense entailed by the removal of the pails; but there is a by-law forbidding the emptying of night soil into the street gutters. It is, however, notorious that there are numbers of persons who actually have the patience to dissolve the solids so as to be able to throw them out into the street gutter without being detected by the police. This disgusting practice is all the more easy because the police, as a body, are badly recruited and doubtless themselves resort to the same expedients in their own homes. The remaining fifth of the inhabitants have cesspools, and of these cesspools three-quarters are *bétoires*—namely, are as porous as possible. They are dug

of the streets had but one central gutter and there were very few sewers. Some years ago, however, the town raised a loan of close on £80,000, which was spent chiefly on sanitary improvements. The water that ran down the street gutters was so limited in quantity that it required a good storm to thoroughly cleanse them. From 1880 to 1882 these central gutters were abolished. The earth underneath them was found to be very black and foul. It was removed, new pavement was put on the streets and two side gutters provided. At the same time the water supply had been greatly increased by the building of new reservoirs and water mains. A number of street fountains were created from whence water could be discharged into the gutters. M. Condor, the town architect or borough surveyor, then introduced an important innovation. At Rouen, Paris and most towns the

street gutters are washed twice a day, when a large quantity of water is discharged into them. But at other times the gutters are almost dry. At night especially, just when people empty the worse filth into the gutters, there is no water to carry it away. It has therefore ample time to sink in between the pavement stones and befoul the subsoil. At Dieppe it was resolved not to flush the gutters twice a day with a large volume of water, but to allow a small quantity of water to run in them all day long and all night. This had the advantage of keeping the gutters always clean, and was not extravagant, for it economised the cost of sending men round twice a day to open and shut the hydrants; nor were there valves to get out of order from constant opening and shutting. If the street is long, and there is no sewer near, then the amount of water running in the gutter is increased; but if the sewer is near, then less water is given. The amount varies from six to fifteen litres per minute coming from each of the numerous water-delivery pipes. The efficiency of this method has been proved, for during the twelve years that it has existed opportunities have occurred of digging up some of the gutters, notably at the Bout du Quai, behind the Maritime Station. Though this is one of the worst quarters of the town, the sand beneath the gutters was found to be quite clean, and very different from what it was under the old method of intermittent flushes. This is, however, just one of the quarters where there has been many cases of cholera. Then, if the map of Dieppe be studied, it will be seen that this district is so close to the beach that it must greatly benefit by the wash of the tide. Why should it not, as a result of this circumstance, have in some measure escaped from cholera like the Perret district at Havre? Perhaps because the houses at the Bout du Quai of Dieppe are older, higher, and if they have the sea on one side, they have on the other side the very foul water of the port.

In building sewers for Dieppe no care whatsoever has been taken of the outfall. The principal outfall is by the fish-market, at that end of the tidal port which is the farthest removed from the sea. On the other side of the port, but nearer the sea and almost immediately opposite the Maritime Station, there is the sewer outfall of the Pollet district. This is equally a very poor quarter and has much suffered. Thus the two worst districts face each other at the entrance of the port, and the port that separates them receives the entire sewage of the town. Further inland, on either side and behind the town railway station, there is a comparatively new district. Here some sewers have also been built and their outfall is in a worse place even than that of the sewers from the older portion of the town. The outfall is in the dock called the Bassin Duquesne. Thus the sewage cannot flow away except when the dock gates are open and the outfall is at the extremity of the dock, farthest away from the dock gate leading into the tidal port. Thus a portion of the sewage is delayed in the dock before it reaches the port; it has time to make deposits which still further contaminate the water. The port is therefore very foul, and this may be one of the causes why cholera gained ground in Dieppe. The subsoil of Dieppe ought to be comparatively pure, because it is washed by the tide; but a glance at the map will show that the greater part of Dieppe lies between the sea and the port and docks. Perhaps infiltrations from the port have done more to befoul the subsoil than the tide of the sea to purify it; and in this respect the position of Dieppe is not similar to that of the Perret district at Havre. The position of the Pollet district is different. It is separated from the sea by the cliffs and possibly when the tide rises the water passing under the Pollet district comes in from the port which it touches rather than from the other side of the cliffs. Thus it is that, though the subsoil waters of Dieppe should be comparatively pure because the tide flows in and out through the flint stones, the water from the dock and port, heavily charged with sewage that finds no ready exit to the sea, may also pass into this porous subsoil and by its foulness defeat the wholesome effect of the pure sea water that comes in with the tide.

In any case, there can be little doubt that the waters of the port are dangerous. Four cases of cholera seem to be due to the effects of the water in the port. A sailor, an abstemious, steady, healthy man, slept on board a tugboat in the harbour close to the sewer outfall. He contracted cholera and died. Another sailor who slept on board a fishing-boat also died of cholera, but he was a man of intemperate habits. The third case was that of a man of steady habits and with ample

means. He likewise slept on board a fishing boat and died of cholera after four days' illness. The fourth case was more remarkable. This was that of a man who lived at a long distance from the port; he was steady and in the enjoyment of perfect health. At ten o'clock in the morning he accidentally fell into the port and swallowed a considerable amount of water before he was rescued. At first he seemed none the worse for this immersion, but later in the day he was seized with cholera and died the same evening. These four cases coming from the port were among the worst that occurred, three out of the four patients dying in a few hours and the other after four days' illness.

Compared with other towns in Normandy, Dieppe is to be congratulated for the energy and enterprise shown by its municipal authorities in seeking to effect sanitary improvements. Unfortunately there is still much remaining to be done. Firstly, a suitable sewer outfall must be found. Doubtless there are topographical difficulties, but these can be overcome by the application of machinery; then there should be no reason why houses should not drain entirely into the sewers, and the filthy pails, the abominable cesspools and the flow of slop water in the gutters could all be abolished. When this has been properly done and the water in the port becomes pure and clean, Dieppe should have little cause to fear cholera.

## CHRISTMAS AT THE HOSPITALS.

AT this season of the year, when peace on earth and good will to men is the prevailing sentiment, it is not strange that those institutions which have been established for the purpose of making glad the hearts and lightening the burdens of those stricken with disease should share in the feeling. The dreary hospital bed has been brightened, the weary sufferers cheered and gladdened by the manifestations of interest taken in them by many of the philanthropic at this season, as well as by those whose duty it is in the hospitals to minister to their diseases.

*Charing Cross Hospital.*—The annual entertainment at this hospital took place on Dec. 21st, 22nd and 23rd, when the students and their friends ministered to the pleasure of those able to attend by the performance of a farce. On Boxing Day the inmates of the various wards were entertained by the resident officers. Mr. Robert Martin delighted the little occupants of the children's ward by the presentation of a large Christmas-tree laden with toys, which will be distributed on New Year's Eve.

*St. George's Hospital.*—On Christmas Day all the patients at this hospital who could partake of the particular fare were supplied with roast beef and plum pudding for dinner. On the following Tuesday a tea and entertainment were provided in the wards.

*St. Thomas's Hospital.*—Christmas Day falling on a Sunday this year the usual Christmas dinner for the patients and the carol singing by the Nightingale nurses were postponed until the following Tuesday.

*King's College Hospital.*—Roast beef and plum pudding were on Christmas Day enjoyed here by many of the patients. In the evening sacred music was discoursed in the chapel. On Boxing Day presents were given to the patients and toys distributed among the children, the afternoon being occupied by the distribution of toys to the children from three large Christmas-trees and a high tea in the brilliantly illuminated wards. The men were provided with cigars &c., and all in the hospital entered into the spirit of this festive time.

*Westminster Hospital.*—The keeping of Christmas was here signalled by the distribution of books, cards, toys, clothing and other presents, and great efforts were made by the medical and nursing staff to make the day a happy one for the patients. On Boxing Day the good cheer with which the season is peculiarly associated was forthcoming. Full and middle diet and even such delicacies as fried fish and Irish stew were suspended for the day and, subject to the permission of the medical staff, every patient was provided with turkey or chicken, followed by plum pudding and, in the case of the men who were able to reach the convalescent ward set apart for them, by the fragrant weed, without which even all the delicacies of the season would fall somewhat flat. Later in the day tea was served also on a festive scale and such amusements were provided as sick folk can enjoy.

*The Royal Free Hospital.*—At this hospital the annual entertainment was given on the 15th inst. On Christmas Day the patients were regaled with fare suitable to their condition; and on Boxing Day a special tea was provided in each ward for the patients and their friends. In the Marsden Ward a dramatic performance was given by the chaplain and his friends on the 27th, the festivities being concluded on the 29th by a Christmas-tree entertainment for the juvenile patients, when over 100 children—past and present patients—were entertained at tea and received suitable presents.

*Great Northern Hospital.*—The Christmas dinner at this institution was enjoyed on Monday, when turkeys were provided by the doctors and dessert by the secretary. In the evening carols were sung by the nurses. The annual entertainment will take place on Jan. 10th.

*Cheyne Hospital for Sick and Incurable Children, Chelsea.*—Turkey and special plum pudding formed the Christmas dinner provided for the little ones at this hospital, which took place on Boxing Day, with a perfect fusilade of crackers to finish up with and a general march-past of dolls and toys.

*Chelsea Hospital for Women, Fulham-road.*—Christmas fare and the distribution of suitable gifts helped the patients to pass a pleasant Christmas at this hospital.

*National Hospital for the Paralysed and Epileptic, Bloomsbury.*—The Christmas festivities in this hospital began with an entertainment on the 22nd inst., and a "waxwork" exhibition afforded great amusement to the patients. The usual fare was provided on Christmas Day. Tea parties have been given and the occupants of the children's ward delighted with a large Christmas-tree. On Thursday a distribution of useful and ornamental articles and carol singing by the nurses concluded the amusements.

*Hospital for Consumption, Brompton.*—The inmates of this hospital, which was most splendidly decorated, spent Christmas Day very quietly, but on Tuesday Christmas revelries began. Turkeys, pheasants, plum puddings, jellies, oranges and other fruits were provided, together with port wine. After dinner and tea songs and games afforded healthy pleasure for the inmates of the institution. On Tuesday next the usual musical entertainment will give place to a distribution of useful and ornamental articles on the Christmas-tree.

*Seamen's Hospital Society.*—The sick and injured sailors in the *Dreadnought* and Branch Dock Hospital were regaled with turkeys and plum pudding on Christmas Day and every effort was made to cheer the patients. The wards were profusely decorated with evergreens and quaint devices constructed by the patients. Every man whose condition would permit was allowed a pint of beer and also to smoke in the wards. Of the 220 patients under treatment there were representatives of no less than thirty-five different nations and castes in the hospitals on Christmas Day, and the Chinaman, East Indian and African were eating their Christmas fare in goodwill by the side of the Britisher, the Scandinavian and the Italian, while the Turk, the West Indian and the Yankee joined this cosmopolitan ship's company. Christmas Day falling on a Sunday the usual entertainment for the patients was held on the following Monday, when the men had a "sing-song" and smoked in one of the wards.

*Hamerton Fever Hospital.*—This hospital being one for infectious diseases could not entertain its inmates in the same way as many of the general hospitals, but the wards were tastefully decorated, and for such as were in a fit condition to participate the usual Christmas fare was provided. Toys were distributed to the children and entertainment provided in a moderate way.

*The French Hospital and Dispensary, Shaftesbury-avenue,* and the *German Hospital, Dalston,* observed Christmas very much in the same fashion as the English hospitals. Christmas-trees, musical entertainments, gifts and Christmas fare were provided so far as was consistent with the health of the patients.

*London Hospital, Whitechapel.*—As Christmas Day came on Sunday, Saturday was set apart for the usual entertainment of the 650 patients in the wards, which were extensively and very tastefully decorated. The patients' Christmas dinner consisted of roast beef and plum pudding, after which they were allowed to smoke, cigars and tobacco being thoughtfully provided by the house physicians and house surgeons. Various entertainments were given—theatricals, concerts, nigger minstrels, songs, recitations, magic lanterns and various side shows. All convalescent patients were up and dressed, and those who could not leave their beds were wheeled into the centre lobbies of the wards, where they

could see the entertainments. On Boxing Day the sisters and nursing staff, now numbering over 250, enjoyed their Christmas dinner. The children's Christmas-tree entertainment and tea will take place on Jan. 3rd.

## VITAL STATISTICS.

### HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns 5915 births and 3915 deaths were registered during the week ending Dec. 24th. The annual rate of mortality in these towns, which had increased from 18·8 to 20·7 per 1000 in the preceding three weeks, declined again last week to 20·0. In London the rate was 19·6 per 1000, while it averaged 20·3 in the thirty-two provincial towns. The lowest rates in these towns were 12·2 in Plymouth, 14·5 in Cardiff, 14·7 in Derby and 15·3 in Portsmouth; the highest rates were 25·1 in Manchester, 25·6 in Bolton, 26·7 in Hull and 27·3 in Brighton. The 3915 deaths included 382 which were referred to the principal zymotic diseases, against 445 and 448 in the preceding two weeks; of these, 126 resulted from measles, 81 from diphtheria, 56 from whooping-cough, 51 from scarlet fever, 38 from "fever" (principally enteric), 22 from diarrhoea and 8 from small-pox. No fatal case of any of these diseases occurred last week in Birkenhead or Burnley; in the other towns they caused the lowest death-rates in Huddersfield, Plymouth, Swansea and Wolverhampton, and the highest rates in Hull, Cardiff, Brighton and Bolton. The greatest mortality from measles occurred in Croydon, Salford, Bolton, Cardiff, Hull and Brighton; from whooping-cough in Leicester and Bolton; and from "fever" in Preston. The mortality from scarlet fever showed no marked excess in any of the large towns. The deaths from diphtheria included 60 in London, 3 in Liverpool, 3 in Birmingham and 3 in Salford. Three fatal cases of small-pox were registered in Leeds, 2 in Leicester, 2 in Halifax and 1 in Oldham; 34 cases of this disease were under treatment in the Metropolitan Asylum Hospitals and not one in the Highgate Small-pox Hospital on Saturday last. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 3299, against numbers declining from 4067 to 3621 on the preceding seven Saturdays; 241 new cases were admitted during the week, against 302, 273 and 286 in the previous three weeks. The deaths referred to diseases of the respiratory organs in London, which had been 339 and 365 in the preceding two weeks, further rose to 380 last week, but were 135 below the corrected average. The causes of 75, or 2·0 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Cardiff, Bolton, Oldham, Newcastle-upon-Tyne, and in eight other smaller towns; the largest proportions of uncertified deaths were registered in Bristol, Birmingham, Liverpool and Blackburn.

### HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had increased in the preceding six weeks from 20·6 to 25·5 per 1000, declined again to 24·0 during the week ending Dec. 24th, but exceeded by 4·0 per 1000 the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 16·5 in Greenock and 18·4 in Paisley to 29·2 in Perth and 30·5 in Leith. The 667 deaths in these towns included 86 which were referred to measles, 13 to scarlet fever, 11 to whooping-cough, 9 to diphtheria, 8 to diarrhoea, 4 to "fever" and 1 to small-pox. In all, 132 deaths resulted from these principal zymotic diseases, against 156 and 136 in the preceding two weeks. These 132 deaths were equal to an annual rate of 4·7 per 1000, which exceeded by 2·7 the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of measles, which had declined from 112 to 87 in the preceding three weeks, were 86 last week, of which 26 occurred in Glasgow, 25 in Edinburgh, 15 in Leith and 15 in Dundee. The deaths referred to scarlet fever, which had been 13 and 18 in the preceding two weeks, declined again to 13 last week and included 9 in Glasgow and 2 in Aberdeen. The 11 fatal cases of whooping-cough exceeded by 6 the number in the previous week and included

8 in Glasgow. The deaths from diphtheria, which had been 13 and 10 in the preceding two weeks, further declined to 9 last week, of which 5 occurred in Glasgow and 2 in Dundee. Of the 4 fatal cases of "fever," 2 were recorded in Edinburgh, where a death from small-pox was also registered. The deaths referred to diseases of the respiratory organs in these towns, which had increased from 134 to 198 in the preceding three weeks, declined to 168 last week, and were 80 below the number recorded in the corresponding period of last year. The causes of 69, or more than 10 per cent., of the deaths in these eight towns last week were not certified.

#### HEALTH OF DUBLIN.

The death-rate in Dublin, which had increased from 22·8 to 24·9 per 1000 in the preceding four weeks, further rose to 26·7 during the week ending Dec. 24th. During the first twelve weeks of the current quarter the death-rate in the city averaged 23·7 per 1000, against 18·1 in London and 23·8 in Edinburgh. The 179 deaths in Dublin during the week under notice showed an increase of 12 upon the number in the preceding week, and included 9 which were referred to "fever," 2 to measles, 1 to scarlet fever, 1 to whooping-cough, 1 to diarrhoea, and not one either to small-pox or diphtheria. In all, 14 deaths resulted from these principal zymotic diseases, equal to an annual rate of 2·1 per 1000, the zymotic death-rate during the same period being 2·2 in London and 6·3 in Edinburgh. The deaths referred to different forms of "fever," which had been 2 and 4 in the preceding two weeks, further rose to 9 last week and, with one exception, exceeded the number recorded in any preceding week during the current year. The mortality from scarlet fever and from diarrhoea showed a decline from that recorded in the previous week. The 179 deaths registered in Dublin last week included 22 of infants under one year of age and 44 of persons aged upwards of sixty years; the deaths both of infants and of elderly persons differed but slightly from those returned in the preceding week. Six inquest cases and 3 deaths from violence were registered and 48, or more than a fourth, of the deaths occurred in public institutions. The causes of 18, or 10 per cent., of the deaths in the city last week were not certified.

## THE SERVICES.

#### MOVEMENTS OF MEDICAL STAFF.

STAFF-SURGEON-COLONEL A. C. GAYE and Surgeon-Captain R. E. Kelly have arrived home from India. Brigade-Surgeon-Lieutenant-Colonel W. McWatters has proceeded to Portsmouth for duty. Surgeon-Captain T. B. Winter, A.M.S., embarked for India on the 15th inst. The following officers have arrived in England on completion of a tour of service abroad:—Brigade-Surgeon-Lieutenant-Colonel Steele and Surgeon-Major Robbins. Surgeon-Lieutenant-Colonel Joynt has left Ceylon in Medical Charge of drafts on his way to England. Surgeon-Captain M'Carthy has been transferred from Cork to Kinsale and Surgeon-Captain Garner to Cardiff.

#### ARMY MEDICAL RESERVE OF OFFICERS.

Surgeon-Lieutenant-Colonel James Keith Anderson, M.D., 2nd Volunteer Battalion Black Watch (Royal Highlanders), to be Surgeon-Lieutenant-Colonel; Surgeon-Captain Edward Bass Reckitt, 1st Lincolnshire Volunteer Artillery (West Liverpool R.A.), to be Surgeon-Major; Surgeon-Captain George R. T. Phillips to be Surgeon-Major.

#### ARMY MEDICAL SERVICE.

*Yeomanry Cavalry*: Shropshire: Veterinary-Lieutenant H. Barnes to be Veterinary-Captain. 1st Durham (West Division, R.A.): Surgeon-Lieutenant J. J. A. V. C. Raye to be Surgeon-Captain; Surgeon-Lieutenant-Colonel Napoleon Bisdee Major to be Brigade-Surgeon-Lieutenant-Colonel.

#### INDIA AND THE INDIAN MEDICAL SERVICE.

2nd Bombay Infantry (Grenadiers): Surgeon-Captain J. B. Smith, I.M.S., to officiate in Medical Charge, vice Surgeon-Captain A. Milne, I.M.S., transferred temporarily to the Civil Department. Surgeon-Captain H. J. Parry, A.M.S., is transferred from general duty, Bombay District, to general duty, Poona District. Surgeon-Captain R. J. A. Durant, A.M.S., is transferred from general duty, Poona District, to general duty, Bombay District. The services of Surgeon-Major A. F. Ferguson, M.B., I.M.S., are placed at the disposal of Government for employment in the Civil Department.

Surgeon-Captain J. Chaytor-White, M.B., I.M.S. (Bengal), is appointed to officiate during the absence of Brigade-Surgeon-Lieutenant-Colonel T. French-Mullen, M.D., as Medical Officer of the Meywar Bhil Corps. Surgeon-Colonel R. P. Ferguson, M.S., is placed on the Administrative Medical Staff of the Army, vice Surgeon-Colonel T. Rudd, M.D., transferred to the home establishment (dated Oct. 27th, 1892). The undermentioned Surgeon-Lieutenants of the Indian Medical Service, appointed to the Bengal Establishment, reported their arrival at Bombay on the dates specified: C. G. Robson Scott and H. M. Earle. Surgeon-Lieutenant-Colonel C. Cameron, I.M.S., Bengal Establishment, is permitted to retire from the service from Sept. 21st, 1892, subject to Her Majesty's approval. Surgeon-Captain F. J. Doves, I.M.S., has returned from furlough out of India. Surgeon-Captain A. E. Grant, M.B., Professor of Hygiene, Medical College, sub. *pro tem.*, is confirmed in that appointment from Oct. 8th, 1892. Surgeon-Captain D. G. Marshall, I.M.S., has been posted to the Civil Medical Charge of Roorkee, in addition to his military duties, from the date of taking charge from Surgeon-Lieutenant-Colonel T. O'Reilly.

#### NAVAL MEDICAL SERVICE.

Staff-Surgeon Richard E. Biddulph has been appointed to the *Canada*. Surgeons: George M'Gregor to the *Canada* and Charles G. Matthews to the *Vernon*.

#### VOLUNTEER CORPS.

*Light Horse*: 1st Forfarshire: Surgeon-Lieutenant W. T. Grant has resigned his commission.—*Rifle*: 3rd Volunteer Battalion, the King's (Liverpool Regiment): William Joseph Murphy Barry, Gent., is to be Surgeon-Lieutenant. 1st Cadet Battalion, the Queen's (Royal West Surrey Regiment): Acting Surgeon T. Holmes has resigned his commission; James Herron, M.D., is to be Acting Surgeon.

#### THE SICKNESS AT PESHAWAR.

It is reported in the Indian papers that in compliance with the desire expressed by Lord Roberts Surgeon-Colonel Cleghorn, Inspector-General of Civil Hospitals, has proceeded to Peshawar to inquire into the nature of the fever prevailing among the troops there and into the sanitary condition of the station generally. Dr. Evans, attached to the Medical College at Lahore, accompanied Surgeon-Colonel Cleghorn to aid him in the investigation.

#### MEDICAL OFFICERS OF THE FOOT GUARDS.

*The World* says that the new system affecting medical officers of the Brigade of Foot Guards is not likely to prove popular. The medical officers are not quite contented with their position, nor are the members of the Brigade satisfied either. It is one of those changes which *The World* thinks would have been better left alone.

#### THE OPENING OF THE NEW NURSES' HOME, EDINBURGH INFIRMARY.

In connexion with the opening of the large building intended as a new home for nurses at the Edinburgh Royal Infirmary, which took place on the 19th instant, we may mention that the suggestion for its provision was first made by the late Surgeon-General Fasson, to whom a memorial tablet is to be placed in front of the building. The successor to the late superintendent is, as we have already announced, Surgeon-Major General Lithgow, M.D., C.B., D.S.O., at present acting as the principal medical officer of the Southern District. The election of this officer for the post speaks well for the reputation enjoyed by the late superintendent and for the opinion which the officials of the Royal Infirmary apparently entertain of a previous training in the army as a qualification for the duties of the appointment, which are difficult to adequately fulfil.

#### PHYSICAL DEVELOPMENT.

Surgeon-Captain Deane has written to our service contemporary the *Broad Arrow* to explain that he decried as useless for muscular development, though excellent as acrobatic performances, certain gymnastic exercises as tests of strength or endurance. Horizontal and parallel bars when properly used are, however, essential in military gymnasia and there are not half enough of them, but the recruit should be led up to the use of these by previous exercise on the ground with dumb-bells in order to obtain their full benefit. This develops the muscles of the arms and chest as well as those of the back and lower limbs. The great point to be secured in the physical training of the recruit is the symmetrical development of every part of the body.

## THE AGE RETIREMENTS IN THE MEDICAL STAFF IN 1893.

Five officers of the rank of Surgeon-Major-Generals and six of the rank of Brigade-Surgeon-Lieutenant-Colonels &c. are due to retire in the course of next year.

## FEVER AT MALTA.

According to an Exchange Company's recent telegram from Malta fever is stated to be increasing among the soldiers of that garrison. It may be assumed that cases of typhoid fever are included under the term "fever," for enteric fever commonly prevails to some extent in Malta during the autumn and early winter. The health of the troops in that command of late years has, we believe, been much better than it was many years ago in this respect, and this has been attributed to the sanitary works that have taken place in the way of water-supply and drainage. Although the barracks have been improved and a large proportion of the troops are encamped during the summer months with manifest advantage to their health, it cannot be said that the barrack accommodation is satisfactory. The buildings are generally old and some of them badly placed, consequently they are not of the construction considered necessary by modern sanitary requirements. The native population is large and generally poor and a good deal of overcrowding exists in the towns. The chief military hospital is not at all a good one and occupies a bad site; but, after all, it is to the character of the barrack accommodation provided for the troops that we must look for the prevention of disease, and for this reason we should be glad to hear that additional barracks are to be built on some healthy open site at a reasonably convenient distance from Valetta or the other overcrowded towns of Malta.

## REPORTS ON RECRUITING.

The War Office has given orders for assistant adjutant-generals for recruiting and officers commanding regimental districts to send in their reports by Jan. 7th; but on the previous day colonels of cavalry and battalions of foot guards are to send to the Horse Guards a special report showing the growth and development of recruits joined during the past year who, at the time of their enlistment, were under the regulated standard of height, weight or chest measurement. Returns, reports and discussions regarding recruits are constantly cropping up, and somehow or other our system does not seem to work very satisfactorily. The army is not popular with "the masses" whatever it may be with "the classes"; whilst the number of candidates for Sandhurst and Woolwich is overwhelming, it is quite the reverse as far as recruits are concerned, although we believe that just at the present time they are fairly numerous. It has often seemed to us surprising, under these circumstances, that the strength of the Royal Marines is not increased. It is a very popular service and there would be no difficulty in enlisting any number of recruits for it. The men of that corps are of fine physique; they cover on parade a larger amount of ground than other troops; they are well-drilled, excellent soldiers, and as they are in the main a very healthy, contented body of men, their state of discipline is perfectly satisfactory. Why not, therefore, increase their numbers?

"Audi alteram partem."

## RICHARD OWEN AND JOHN HUNTER.

To the Editors of THE LANCET.

SIRS,—Ham churchyard was the scene to-day of an unwanted throng when the great naturalist was laid to rest. Our own profession was well represented by the President of the College of Surgeons, by Sir Joseph Fayrer and others, and many leaders in science stood around. The simple service in the church seemed well to befit the veteran who is gone; thoughts of his genial yet reverent spirit in peaceful old age came over the mind as the preacher read of man that liveth by reason of strength to fourscore years. The stillness was unbroken save by the twittering of birds in the leafless trees. The level rays of the low December sun shone on the company of mourners. It had been overcast with heavy grey clouds, but as the service went on the sky grew clear and blue and the dark clouds lay piled away on the eastern horizon, their summits tipped with rosy light

from the setting sun—a peaceful close to a long day of life. Few now living knew Sir Richard Owen in his prime. He became famous early, and even the old amongst us have looked up to him as a leader from their own young days. He was a link with past generations and his memory is worthy to be cherished. My own knowledge of him was only in his old age, when his work was done and he was quietly waiting for the end; yet there was about him still a wonderful grace of manner, a kind and cordial speech and nothing of that impatience of new ways and discontent with their surroundings which is oftentimes excusable in old men. He loved to speak of his own work, but not in pride, and looked upon his honours rather as kindnesses received than as rewards for merit. Especially he would talk of Cuvier and how when Cuvier, obliged to flee France, was studying in the Hunterian Museum Owen was appointed to attend on him, and how cordially they worked together "like friends." A fine large medallion of the great Frenchman adorned Sir Richard's study; above it an admirable miniature of John Hunter, inherited from Wm. Clift and highly prized by him; above this a portrait of William Clift himself in his old age; and Sir Joseph Banks surmounting all. It is as a link with Hunter that I would speak of Owen. Although not born until eleven years after Hunter's death, Owen earned the right to be his chief interpreter. Indeed he comes down to us in direct succession from Hunter. William Clift was Hunter's last and favourite pupil and "entered most [I quote from Owen's words to me] into his master's spirit. His was a singular example of lifelong devotion, entire and absolute, to one object—the memory of his master, John Hunter, and the care of his collection. He had no aims of his own, no thought of distinguishing himself; his one care was the pursuit of his master's work." With such a man was Owen associated, as his assistant in the care of Hunter's Museum from 1827 to 1842, when he succeeded Clift, already bound to the latter by the close tie of a son to a father. William Clift died in 1849. When Owen published in 1861 the well-known edition of Hunter's (posthumous) Essays and Observations, taken from copies so long preserved by Clift, he wrote in his dedication that his "labours in making known the thoughts and works of the founder of philosophical surgery" were now terminated. He told me himself that it had been throughout life one of his chief aims to preserve the memory and carry on the work of that great man. And so in losing Owen a link which bound the present with the life and work of John Hunter is broken and his days seem to recede into a more distant past. The coming year is the centenary of John Hunter's death, which took place on Oct. 16th, 1793. It would surely be fitting to commemorate in some way this event. The Hunterian Society (of which I am one of the honorary secretaries) will, I think, make some endeavour to this end, but it is much to be hoped that some larger bodies will take the matter up. Not alone the medical art, but the kindred study of biology in its wider bearings owe much to John Hunter, and I trust that next October will witness some worthy memorial of his name and fame.

I am, Sirs, yours faithfully,

Dec. 23rd, 1892.

R. HINGSTON FOX.

## THE LATE DR. WALSHÉ.

To the Editors of THE LANCET.

SIRS,—I have read with much interest the letter of Dr. Sturges, in your last issue, on Dr. Walshe. I only had the honour of Dr. Walshe's friendship during the last seven years of his life, but confess that the interpretation of his character which Dr. Sturges sets forth does not altogether satisfy me as being a correct image of "the man." Of his method and of his refinement in observation and description I think his account is excellent; but Dr. Sturges appears to me to view Walshe as a physicist who degenerated into a metaphysician. The conclusion which my intercourse with him would lead to is that he was a metaphysician who had forced himself in a measure to become a physicist, but only in a measure, for he had in a rare degree the attributes of both. His refinement in description, indeed, was, in my opinion, a consequence of that mental habit which felt itself surrounded by "unending Nature," as various in expression, as unfathomable in itself. He was good enough at one time to express concern lest I should develop too metaphysical a vein, and advised me to stick to clinical work. "That's

<sup>1</sup> See also the Memoir of William Clift (a brochure), by Owen.

the thing that pays," he said; and added, "I never published anything metaphysical until I could afford to do without medicine." That his exquisitely sensitive nature under the influence of physical pain, was apt at times to take a materialistic and pessimistic view of things must be well known to his friends; but this was but a symptom of suffering. Walshe had too great an intellect and too much music in his own soul not to echo the harmonies of the "Unseen," and although, like the Æolian harp, he may not always have known whence the movement came, when free from physical distress his fine organisation felt it and the music was there. The marvel to me is that one so endowed with the faculty for abstract speculation should have so mastered what he himself termed the "fascination" of that tendency as to place himself in the front rank of the physical observers of his day. Whether the method of Walshe or the method of the present day will be most lasting in its influence remains for the future to decide.—I am, Sirs, yours faithfully,

Dec. 26th, 1892.

### THE VALUE OF SUTURES IN THE TREATMENT OF CUT THROAT.

To the Editors of THE LANCET.

SIRS,—I have read Mr. Henry Morris's clinical lecture on the value of sutures in the treatment of cut throat, reported in your last issue, with much interest, and desire, by reference to my own experience, to support the practice which Mr. Morris has so ably advocated. The improved treatment of cut throat is but one more instance of the way in which aseptic surgery has revolutionised old methods of treatment. No doubt the dread of putting sutures in deep wounds of the throat was amply warranted in the days of septic surgery; but that it should still hold sway in the surgical mind is strange indeed. By careful suturing wounds in the throat, which formerly took many weeks to close by granulation, may now heal in as many days. During the period between October, 1882, and October, 1884, whilst I was resident surgical officer in the Manchester Royal Infirmary, it was my duty to initiate the treatment of several bad cases of cut throat and I soon emancipated myself from the dread of sutures. Two of my cases were so very similar to those described by Mr. Morris that I should like to refer to them. The cuts had passed through the thyro-hyoid membrane close to the thyroid cartilage, and had so completely severed the connexions between the latter and the hyoid bone that the larynx dropped down, leaving a wide gap through which the posterior wall of the pharynx was displayed. It seemed hardly possible for such wounds to heal without sutures. At first I tried to suture the thyro-hyoid membrane, but owing to the small amount of that structure which was attached to the thyroid cartilage the hold of the first few stitches inserted was insufficient to bear the strain, for the muscles attached to the hyoid bone on the one hand and to the thyroid cartilage on the other held these structures apart with considerable force. In order to overcome them a suture was passed over each great cornu of the hyoid bone by means of a Liston's needle, and by the same means the deep end of each suture was drawn through the upper part of the ala of the thyroid cartilage. These sutures were tightened up and tied simultaneously. In this way the larynx was suspended from the hyoid bone and all strain on the thyro-hyoid membrane was removed. The edges of the latter membrane were then accurately adjusted with fine sutures. The ends of the wound in the superficial tissues were sutured, but the central part was left open. This treatment proved very successful in both the cases. In recent years the practice of suturing the tissues layer by layer has been pretty generally employed, and in my opinion Mr. Morris is quite right in making no exception in the neck.

I am, Sirs, yours faithfully,

BILTON POLLARD, F.R.C.S. Eng.

Harley-street, W., Dec. 22nd, 1892.

To the Editors of THE LANCET.

SIRS,—The very interesting and instructive clinical lecture of Mr. Morris, in the last issue of THE LANCET, reminds me of a case of cut-throat occurring in the same individual on three separate occasions. The patient was under the care of the late Mr. Taylor, of Wargrave, Henley-on-Thames. He was the proprietor of a small roadside inn and was addicted to intemperate habits, and it was during these freaks that he attempted suicide by cutting his throat with an ordinary

table knife. His first "performance" upon his neck occurred somewhere about the year 1864, his second the following year, and his last "operation" about eighteen months subsequently. I was assistant to Mr. Taylor and was present on each occasion when this publican was attended. The first and second wounds were situated above the pomum Adami and extended, as far as I can recollect, about two inches and a half on each side of the median line. No important structures were severed, nor did any vessel need torsion or ligature. The last wound, which was inflicted below the old scars, however, was of a more serious nature, inasmuch that the trachea was divided, yet no vessel required to be dealt with. The man resided about a mile off, and was attended at his house on his first and second injury, but on the last occasion he was conveyed to the surgery in a wheelbarrow. The treatment adopted throughout consisted of several silk sutures, bandages and lead lotion, his head not being fixed, and he was fed from the beginning with beef-tea and milk. He eventually succumbed from some pulmonary complication, I think, within a week of his last attempt upon his life.

I am, Sirs, yours obediently,

Camberwell-green, Dec. 26th, 1892.

J. FRENCH BLAKE.

### "CHLOROFORM ADMINISTRATION."

To the Editors of THE LANCET.

SIRS,—The conclusions of the Hyderabad Commission as to the way in which chloroform kills not having met with universal acceptance, I think it right that all cases of death from chloroform should be reported in the journals. I therefore beg to send you the following details of a case in which I administered the anæsthetic: The patient was a female aged fifty-eight. The operation was for removal of a tumour of the face. Chloroform was administered by being dropped upon the outside of a cone formed by the corner of an unfolded towel, in the manner suggested by Sir Joseph Lister. The heart was examined before the operation and nothing abnormal detected. The patient was nervous and said she was afraid of the chloroform, but took it well. The operation was commenced and about ten minutes afterwards she vomited slightly; when that ceased she was again completely anæsthetised and her pulse and breathing were good and regular. About four or five minutes later she became suddenly pale, her pupils dilated widely and her pulse could not be felt (it was felt to be good almost immediately before and the cut vessels in the wound were spurting freely). She respired once or twice spontaneously before artificial respiration was commenced. After its commencement the pupils slightly contracted, but almost immediately dilated again. Nitrite of amyl and ammonia inhalations, hot sponges to the præcordium and injection of ether were also used without effect. Post mortem the heart was contracted and contained but little clot. The heart walls were not pale or markedly soft; the valves were slightly thickened at their free edges. Below the aortic valves and in the lower part of the aorta were some small patches of atheroma. The lungs were slightly emphysematous and had some scarring at the apices, but were otherwise healthy. There were some fibroid tumours of the uterus and the other abdominal organs were healthy. Death in this case appears to have been certainly due to heart failure, as the respiration continued after the imperceptibility of the pulse and change in aspect had been noted.—I am, Sirs, yours faithfully,

FRANK HINDS, M.D., B.Sc. Lond.,

Dec. 27th, 1892. Hon. Medical Officer to the Worthing Infirmary.

### "COLOUR VISION."

To the Editors of THE LANCET.

SIRS,—In your last issue you publish a critique upon the report of the Committee of the Royal Society upon Colour Vision. In it you say: "The test to be used for colour vision are the wools of Holmgren, the sets to be approved by the central authority." You make no mention of my colour circle, which has been devised for making Holmgren's test more rapid and convenient and offers facilities for permanently registering the mistakes of those who are examined. The words of the committee's recommendations are (page 18): "The simplest efficient test is the wool test of Holmgren, applied either in the form which Holmgren recommends or in that of Jeaffreson." The report gives a good illustration of the instrument (p. 112) and further says (p. 19): "In

Jeaffreson's form of this test the handling of colours is avoided, the match being made as there described. The hesitation evinced by the colour blind in matching the test colours in this instrument is also of great utility to the examiner. Moreover, it has been found practically that as many or even more persons can be examined in a given time by it than by the original plan. The committee are therefore of opinion that this modification may be admitted if desired by the examiner." I write this letter not only in my own justification, but in that of Messrs. Curry and Paxton, who have gone to a good deal of trouble and expense in perfecting this apparatus.

I am, Sirs, yours faithfully,

C. S. JEAFFRESON, F.R.C.S. Eng.,

Senior Surgeon to the Northumberland, Durham and Newcastle  
Dec. 22nd, 1892. Infirmary for Diseases of the Eye.

#### "ON THE DIAGNOSIS OF THE DIFFERENT FORMS OF PROSTATIC ENLARGEMENT."

To the Editors of THE LANCET.

SIRS,—Mr. McMunn is under a misapprehension. The instrument lent me did not in my hands fulfil the expectations I had formed. I therefore requested Messrs. Meyer and Meltzer to make me a urethrometer of the ordinary type adapted to the prostatic portion of the urethra, and I have never claimed or thought of claiming any originality in connexion with it. The best proof that the idea was not borrowed from Mr. McMunn is the trouble he has taken in his letter to show that the principle upon which the instrument is constructed is such a bad one.

I am, Sirs, yours truly,

Wimpole-street, W., Dec. 28th, 1892. C. MANSELL MOULLIN.

#### "EXPERIMENTS ON LIVING ANIMALS."

To the Editors of THE LANCET.

SIRS,—Mr. Lawson Tait in endeavouring to maintain his dictum that the healthy peritoneum is extremely sensitive seeks refuge in a supposition that, although the healthy peritoneum of "animals" is insentient, the same membrane is, on the contrary, in man acutely sensitive. He appears in so doing to forget the fact that my letter was corroborative of surgical experience on the human peritoneum already expressed and published conversely to the supposition he now advances. The evidence from the laboratory is therefore in accord and not, as Mr. Tait alleges, in disaccord with observations upon man. From an experimental point of view the matter seems hardly debatable further. At present all Mr. Tait has done is to repeat an assertion, which, I would remind him, is not the same thing as to substantiate it. It will require time, he says, before he can verify the unqualified contradiction he gave to the statement in the recent lecture by Dr. Gee. Dr. Gee's statement has already received a twofold ratification in the medical press. Would it not have been a better course had Mr. Tait taken the time and trouble to verify his contradiction before instead of after making it?

I am, Sirs, yours faithfully,

C. S. SHERRINGTON, M.A., M.D.

St. George's-square, S.W., Dec. 24th, 1892.

### LIVERPOOL.

(FROM OUR OWN CORRESPONDENT.)

#### *Christmas and the Poor.*

CHRISTMAS has come and gone with the usual festivities. A pleasing feature of the latter is the large amount of gifts in money and food—chiefly the latter—bestowed upon the deserving poor. The "hot pot" fund, which was originated some years ago, has become a hardy annual, and by its means a large number of families receive a substantial dinner of meat and potatoes. Generous tradespeople follow the good example with gifts of tea &c., and thus a large number of the hungry are fed with good things. It was all the more welcome this year, the weather having been before, during and after Christmas Day most unusually severe.

#### *Death of Dr. Costine.*

David Dunlop Costine, M.D. St. And., L.F.P.S. Glasg. L.S.A., died somewhat suddenly just as he had attained

the age of sixty, his death occurring on the 23rd inst., his sixtieth birthday. The life of the deceased is an excellent illustration of what may be done by energy and perseverance. Coming from Scotland many years ago to Liverpool a perfect stranger, the deceased worked his way up step by step from a very humble position to a prominent place in the profession as well as in public life. He became a student at the Liverpool School of Medicine in 1860, and on the completion of his studies a few years later he commenced private practice in the north end of the city, a locality where a doctor was then much wanted. He soon acquired a large practice and became a member of the Everton Board of Guardians, taking also a prominent part in politics. It was mainly through his exertions that the Stanley Hospital was first completed and then enlarged; it continues to fulfil the purpose for which it was erected in a large and crowded district and will remain as a graceful monument to the memory of its founder. The funeral, which took place at St. James's cemetery on the 26th inst., was largely attended, in spite of the severe weather, by professional and private friends, representatives of the different public bodies and institutions to which the deceased belonged and of the general public. Dr. Costine was some years ago made a justice of the peace and on the day of his funeral references were made by the magistrates and the city coroner to his death and to the estimation in which he was held. He was married, and a son is in the profession.

#### *A Man Frozen to Death.*

The body of a tug boatman was found on the beach at the Dingle on the afternoon of Christmas Day. He had evidently been frozen to death, the weather being bitterly cold with a strong south-east wind.

#### *Hospital Sunday.*

The second Sunday in the year was chosen from the first as that on which collections shall be made for the hospitals and other medical charities, the first Hospital Sunday having been held on Jan. 8th, 1871. By the usual coincidence of years, the twenty-second anniversary will take place on the same date next year. The committee, in their last annual report, lament the want of elasticity in the amounts of the church collections, and the lament is well founded. Starting under most unfavourable circumstances, and after surmounting almost superhuman difficulties the first year's collections exceeded by £700 the £4000 which the promoters of Hospital Sunday here had modestly predicted. The next year, 1872, the collections closely approached £8000, in 1873 this sum was exceeded, while in 1874 the collections considerably exceeded £10,000, the Hospital Saturday Fund amounting then only to a few hundreds, swelling the total to upwards of £11,000. Since then the tendency has been to stagnate or fluctuate; there has not been the continual steady rise which was hoped. But if Liverpool could raise nearly £11,000 in 1874, surely the amount in 1892 should be in excess of this sum. A sum should be fixed upon as the amount which ought to be raised, say £15,000, and every effort should be made to reach this.

#### *Hospital Accommodation in Liverpool.*

And this leads me to turn to the institutions for which Hospital Sunday and Saturday were established. In Liverpool hospitals have not kept pace with the increasing population as in many of the older towns and cities. Although Liverpool received its charter from King John it did not possess any medical charity till the middle of the eighteenth century, when the first infirmary was built. The Northern Hospital was not founded till 1834, or the Southern Hospital till 1841, each being urgently needed by the rapid growth of the town. Then in 1867 came the Stanley Hospital, thus completing four general hospitals for a population of nearly 600,000. In Dublin, with less than half this number, there are ten general hospitals. Though fairly well supplied with dispensaries and special hospitals these cannot be said to be excessive considering the population and its continued increase.

December 28th.

### NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

#### *Outbreaks of Small-pox.*

SMALL-POX has appeared in various places in North Yorkshire and in parts of Durham. Cases are reported from Bedale and Weardale. As a rule these cases occur in the persons of

tramps and such-like wayfarers and are promptly isolated. More general attention is being paid to vaccination, re-vaccination and sanitary measures.

#### *Tyne Port Sanitary Authority.*

At the late meeting of the Tyne Port Sanitary Authority it was agreed to increase the salary of the medical officer from £80 to £100 per annum, and that a gratuity of £20 be further paid him on account of his extra services during the recent cholera scare, so-called. But the medical officer did more: he stayed up all night in the cholera hospital with a patient and remained with the man until he died. Never was a gratuity better deserved.

#### *Sunderland Infirmary and its Convalescent Home at Harrogate.*

An invitation given to the men of the various collieries which contribute to the Sunderland Infirmary to send representatives to the new home at Harrogate has been very freely accepted and must have a good effect on both charities. The more that working men can be induced to take a direct interest in all medical institutions the better for all concerned.

#### *The Thirsk Railway Disaster.*

The driver of the Scotch express on the morning of Nov. 2nd, when the fearful collision occurred at the Manor siding, near Thirsk, is reported to be able to sit up, and it is expected he will be able to leave the Lambert Memorial Hospital, Thirsk, this week and return to Gateshead, where he resides.

#### *"The Human Frog."*

A case which has excited a good deal of curiosity of a certain kind and was exhibited about Hartlepool and Stockton as a "human frog" was provided for by Drs. Gourley and Morison last week, when they made an order for the inspector in lunacy to take the so-called "frog" to the county asylum. The "frog" is a poor, decrepit imbecile, and it is said that he was sold by his father to a showman.

#### *Bequests to Newcastle Charities.*

The late Mr. Robert Daglish has left the following bequests to Newcastle charities: Royal Infirmary, £500; Newcastle Deaf and Dumb Asylum, £500; and to the Home of the Little Sisters of the Poor, £100.

Newcastle-on-Tyne, Dec. 28th.

## IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

#### *Meath Hospital, Dublin.*

At a recent meeting of the Standing Committee, the following resolution was passed unanimously: "That this committee, having heard of the resignation of Dr. Arthur Wynne Foot, senior physician to the hospital, on account of ill-health, feel they cannot let the opportunity pass without expressing their extreme regret at his severance from the medical staff after his long and faithful service. They sincerely trust that he may soon be restored to health, and be enabled to resume his many other professional duties."

#### *Dublin Main Drainage Scheme.*

A deputation representing the Main Drainage Committee of the Corporation of Dublin last week had an interview with the Chief Secretary and Colonel Le Mesurier (representing the War Office) for the purpose of explaining the views of the committee with reference to the objections to the scheme by the War Department. It appeared that the Main Drainage Scheme had been sanctioned by the Local Government Board, but that the War Office had objected to the construction of the proposed main outfall sewer at the Pigeon House Fort, on the ground that the health of the soldiers stationed at the Fort would be endangered in the event of that portion of the scheme being carried out. After some discussion it was eventually decided to communicate with the War Office authorities, setting forth what the Corporation were prepared to undertake, with a view to meeting the objections to the scheme and removing the obstacles which at present impede the progress of the work.

#### *Richmond Hospital, Dublin.*

By the will of the late Mr. Louis Higgins, a sum of £5000 has been left for charitable purposes, and the executors intend to devote the entire sum to the rebuilding of the Rich-

mond Hospital, which is in a very bad condition. A further sum of £6000 is also forthcoming, and this £11,000 will be sufficient to rebuild the hospital.

#### *Royal Hospital for Incurables.*

The board have resolved to erect a second pavilion, containing two wards, which will provide accommodation for fifty-two beds.

#### *Health of Dublin for November.*

As compared with the previous month, there was a trifling increase in the mortality ascribed to typhoid fever. The deaths from diarrhoea decreased largely. One small-pox patient was admitted into Cork-street Fever Hospital from Blackrock. The death-rate was 27.1, and the zymotic death-rate was 1.8 per 1000 below the mean rate during the month of October for the previous ten years.

#### *"Political Insanity."*

In the new edition of his book on forensic psycho-pathology Professor von Krafft-Ebing has added a new chapter on "political insanity," from which I quote the following: "In history and in our own time one comes upon large numbers of people who, discontented with social arrangements, feel called upon to better the world. There are innumerable such pseudo-geniuses in society, both in the harmless province of important inventions and proposals for the public good which prove in the light of criticism to be mere vain desires or Utopias. The clinical marks of these abnormally constituted persons are infinitely various. In many the mental endowment is weak and their intellectual productions bear the stamp of crazy eccentricity which clearly distinguishes them from those of genius. Many such remain all their lives in the stage of abnormal world-menders and pothouse politicians, but from the suggestions of others or the influence of excited times they are apt to lose the remnant of their discretion. Then they feel impelled to convert their ideas into action. They appear in the rôle of tribunes of the people, leaders of rebellions, founders of sects or political parties and plunge themselves and others into misfortune." Further on he says: "Such unfortunates fall at last into complete megalomania and if they obtain power for a time they use it in accordance with their degenerate natures as tyrants ..... If they are placed in lunatic asylums they regard their sequestration as actuated by envy and fear of their great talents and go on cultivating their 'ideas,' awaiting the time of their realisation. Their final fate is extreme megalomania, confusion, psychic debility."

#### *Statistics of the Medical Profession.*

The following statistics are taken from Dr. S. Guttman's Medical Calendar of the German Empire. The number of medical men in Germany is 20,500. It has increased more than 21 per cent. during the last five years. The number of medical men in Prussia is 12,074, in Bavaria 2345, in Saxony 1533, in Baden 811, and in Württemberg 711. The corresponding number in Berlin and its suburbs is 1636. The number of medical men in Germany per 10,000 inhabitants is 4.15. The number of dentists in Germany holding German diplomas is 828. The number of apothecaries' shops is 4964. The number of hospitals is estimated at 3109, with 185,069 beds—i.e., 37.44 beds per 10,000 inhabitants.

#### *Cholera and Diphtheria.*

At the December sitting of the Society for Public Hygiene Dr. Wernicke of the Hygienic Institute of Berlin University reported the results of his investigations of cholera and diphtheria bacilli. He has found that the pink reaction under sulphuric acid, is not so peculiar to cholera bacilli as has hitherto been thought. He maintains also that the danger of the transmission of cholera by tobacco is very small. Cholera bacilli die on tobacco leaves. He has succeeded in producing a very high degree of immunity against diphtheria in dogs by injecting weakened diphtheria cultivations. With the blood serum of such a dog he completely protected guinea-pigs against artificially produced diphtheria.

#### *Cholera in Hamburg.*

Between the 28th ult. and the 12th inst. only one case of cholera occurred in Hamburg, but about fifteen have been

reported since then, so that spring and summer are looked forward to with considerable anxiety.

#### *Cholera Statistics.*

It is now officially stated that the number of persons who died of cholera in Germany during the recent epidemic was 8510, of whom 7611 died in the City and State of Hamburg.

#### *Louis Pasteur.*

The Medical Section of the Institut de France has invited the Society for Internal Medicine here to take part through delegates in the celebration of Pasteur's seventieth birthday. The Society has elected Pasteur an honorary member.

#### *Miscellaneous Items.*

Dr. Baginsky of Berlin University has been promoted to the rank of Extraordinary Professor. — Surgeon-General Schaper, the new medical director of the Charité, entered on his office on the 14th inst.—Herr Kühler, Director of the Imperial Office of Health, is seriously ill.

December 20th.

## VIENNA.

(FROM OUR OWN CORRESPONDENT.)

### *Cholera in Austria-Hungary.*

FRESH cholera cases have occurred during the last week in Galicia, near the Russian frontier. Single cases are reported from the town of Husiatyn and the villages Zaluozce, Wierbowka and Siekierzyne in Galicia. It is stated that the cholera is raging severely in the adjacent port of Russian Podolia. At Budapest there are still nine cases of cholera at the cholera hospital and a case of cholera was stated to have occurred at Esseg in Croatia. It is feared by the sanitary authorities that the epidemic will spread in Austria and Hungary in next spring. At the last meeting of the Styrian Society of Physicians at Graz Professor Klemensiewicz announced that he had found a new method for staining the comma bacillus and that by this method the flagellum of the bacillus could be made visible, so that it could be easily distinguished from other similar bacteria. The researches on this matter, however, are not yet concluded.

### *Operation for Cataract.*

Professor Fuchs of Vienna gave recently an interesting lecture on the methods of operating for cataract, in which he stated that the excellent results obtained by Professor Wecker of Paris with the old method of Daviel and Beer (who performed extraction without iridectomy) induced him to try the same method again at his clinic. Between May, 1890, and November, 1892, 1344 cases of cataract were operated upon—702 of them by Professor Fuchs himself and in 311 of these without iridectomy. The results were very favourable with the elder (Beer's) method, as only 0.9 per cent. of the cases were unsuccessful, while with the other method the percentage of non-success was 2.3.

### *Pasteur's Seventieth Birthday.*

At the last meeting of the Vienna Society of Physicians it was resolved to present an address to M. Pasteur on his seventieth birthday.

### *Medical Provident Society.*

A new medical society has been formed here for the aid of physicians who have become disabled or ill. The annual subscription is 30fl. (50s.). Three hundred members have joined the society.

December 20th.

## Obituary.

WALTER HAYLE WALSH, M.D. EDIN., F.R.C.P. LOND.

WALTER HAYLE WALSH, the son of William Walshe, a barrister of great promise who died at the early age of forty-eight, was born in Dublin on March 19th, 1812. He entered Trinity College, Dublin, in 1827, and continued to the third year of study, but did not proceed to the degree of B.A. The intention up to this time had been that his profession should be that of a barrister-at-law; but he preferred another course, and in 1830 went to Paris, whither his mother had already gone with the idea of making her permanent residence in France. From advice then given by an old family friend, he

in 1830 began the study of Oriental languages, commencing with Arabic, but after two years gave up the idea, to use his own expression, of "pushing himself in life as an Oriental linguist," although assured there was a "fine opening" in India for anyone who could attain even moderate skill in the use of three or four of the current tongues. To those who know Dr. Walshe's great classical learning, and his latest work on the "Colloquial Faculty for Languages," published in 1886, it may appear strange that one so highly gifted as he was in this particular direction, as well as in the mastery of language on its scientific side, should have relinquished this pursuit at that time and have commenced the apparently uncongenial study of medicine. This was in 1832, but at that time physical and biological science presented an immense attraction to young Walshe; and so he began, in October of that year, to attend the practice of Boyer and Roux at La Charité in Paris, and to dissect and follow other kindred studies in the same metropolis.

In the beginning of 1834 the most important event of his professional career occurred. It was then that he became acquainted with M. Louis, and the impetus given to his mind was intensified by his devoted study in the clinique of that physician at La Pitié; and thenceforward, until the end of his long life, he never swerved from the lines laid down and illustrated by his great master. The natural inborn bias of Dr. Walshe's mind was towards strict observation and inductive reasoning; and in the school of Louis this bias was so accentuated as to develop in him an equally potent "polar" repulsion in regard of imperfectly noted facts and *a priori* reasoning of all or any kind. The great teachers "at whose feet he sat," to use his own expression, and whom he specially remembered with gratitude and admiration, were Brard, Orfila, Dumas, Cruveilhier, Andral, de Blainville, Dubois, Velpeau, Ricord and Marjolin. He was dresser to Dupuytren for some months and attended the extra-professional lectures of Michelet, Flourens and Arago among others. In 1835 he was elected a member of the Société Médicale d'Observation, being nominated by his friends and colleagues, Dr. Oliver Wendell Holmes and M. Valleix—M. Louis being president. In the August of the same year, 1835, Dr. Walshe left Paris for Edinburgh, and there became acquainted with his uncle, the Rev. R. O. Shannon of the Episcopal Chapel, York-place, who had for a long time been one of the most popular and socially prominent men in the "Modern Athens." To this intercourse Dr. Walshe often referred as being one of the great helps he had received in the cultivation of his literary taste. In 1836 he proceeded to the degree of M.D. in Edinburgh, and immediately after graduating returned to Paris. M. Louis was kind in introducing him to a few English families, but Dr. Walshe felt that he was wasting time, and in 1838 came to England and commenced medical practice in a very humble manner in the north of London.

During the years 1839 and 1840 Dr. Walshe was a vigorous writer on pathology, contributing the articles on Cancer, Endosteitis, Cephalæmatoma, Ectopia, Emphysema (surgical), Empyema and Thoracic Fistula to Costello's "Cyclopaedia of Surgery"; and, but several years later, the very remarkable paper on Adventitious Products to Dr. Todd's "Cyclopaedia of Anatomy and Physiology." The article on Cancer was written in 1840, and was the foundation of his important and quite classical work "On the Nature and Treatment of Cancer," published separately in 1846. In the preface to this book Dr. Walshe refers to the "flattering reception with which the article on Cancer in the 'Cyclopaedia of Surgery' was honoured by the profession," and to the fact that in 1844 Dr. Mason Warren, of Boston, produced an American edition of it as a separate book. It was doubtless in consequence of the high distinction as a pathologist obtained by Dr. Walshe as the author of these masterly papers that the Council of University College in 1841 elected him, in succession to the late Sir R. Carswell, as their Professor of Morbid Anatomy, an office which he held during the following eight years, when he succeeded the late Dr. John Taylor as Special (Holme) Professor of Clinical Medicine. The duties of this office were those of minute personal instruction of the students in the wards of the hospital and the delivery of clinical lectures. Those were very high days in University College and its hospital. The colleagues of Dr. Walshe in the Faculty of Medicine were Lindley, Grant, Graham, Fownes, Quain, Sharpey, C. J. B. Williams, A. T. Thomson, Ellis, S. Cooper and Liston; while in the Faculty of Arts, in which he always took a most lively interest, were Augustus de Morgan, H. Malden, George Long, T. H. Key, R. Potter, R. G. Latham, Tom Taylor, Merlet, Cressy,

Donaldson, Hurwitz and many others. The active professional career of Dr. Walshe was so closely associated with the years of his connexion with University College from 1841 to 1862 that it would be well to complete this part of that history here rather than interpolate with it the various contributions made to literature in their chronological order. When in session 1846-47 Dr. Walshe became Special Professor of Clinical Medicine, he was elected physician to the hospital and as such continued until 1861-62, when, upon retirement from active duty, he was elected Consulting Physician and Emeritus Professor of Medicine and Clinical Medicine. In 1848, upon the resignation of Dr. C. J. B. Williams, Dr. Walshe was appointed Professor of the Principles and Practice of Medicine, an office which he held with great distinction and success during fourteen years. Throughout this time he delivered regularly most important "clinical" lectures, in addition to those of the "systematic course"; and it is by many of these, as well as by much systematic writing, that his work will be best remembered. In the three professorships he had filled he was succeeded by Sir William Jenner, and in mentioning this illustrious name it seems a fitting place in which to mention some others of his colleagues—viz., Edmund Parkes, Sir A. Garrod, C. J. Hare, Wilson Fox,\* Maudsley,\* Russell Reynolds,\* J. E. Erichsen, John Marshall, Burdon-Sanderson, Alexander Williamson, George Harley, Graily Hewitt,\* Michael Foster,\* Charlton Bastian,\* Sir Henry Thompson\* and Wharton Jones, while in the Faculty of Arts there were Farinelli, Croom Robertson, Masson, John Sealey, Hirst and others. These names<sup>1</sup> are selected from the large list of contemporary professors because, from the writer's personal knowledge, each of them entertained a very high regard for their distinguished colleague.

As a professor both in the "clinical" and "systematic" courses, it is difficult to imagine anyone more highly gifted than was Dr. Walshe. He was profoundly and accurately learned in the literature of every subject upon which he spoke and upon the cognate subjects of more specifically scientific processes which could throw any light upon his subject matter. He arranged all his work with the most rigidly logical precision; and every individual lecture furnished a separate and complete model of scientific carefulness. His method of representing facts was essentially "the numerical"; his mode of arriving at conclusions was "per viam exclusionis." He handled theories, bygone doctrines, present fancies and working hypotheses with equal ease; placed them either side by side, in sequence or face to face with facts as the need might be; brought out their value, often not fully seen before, or destroyed them with a relentless energy whenever they were fit only for destruction; and on those ten fingers, which seemed all alive with redundant energy, enumerated point by point achieved, until the members of his class used often to look at one another with an expression of amazement that what before had seemed so vast, so complicated, so obscure, so misrepresented, so hard and so well nigh impossible to understand, could be so robbed of showy clothes, stripped bare of all misconception and made so clear and simple as it now was by the apparently easily-used magic of their great teacher's mind. His language was well chosen, his delivery remarkably rapid, fluent, precise and yet easy to follow; he was often rhetorical, and when he chose highly eloquent, but in ordinary lectures he was instructive by his great learning, convincing by his vigorous logic, and fascinating by the beauty of his style and the obvious earnestness of his conviction.

At the bedside he was most precise and methodical, and gave all his powers to the accurate observation and record of facts. The history of each case was "taken" by his clinical clerks under the direction of his house physician, and this being read to him the "present state" was dictated by himself and taken down then and there in the ward-book. This was done always, and also in his own notes of private cases, according to the scheme drawn up by the "London Medical Society of Observation" (of which he was the founder) under the title of "What to Observe." The notes were long and elaborate as a rule, but sometimes they were amusingly short—e.g., after for many minutes endeavouring to ascertain from a somewhat confused man, who could articulate easily enough and apparently quite intentionally, but who could not put out his tongue although he said he could, Dr. Walshe summed up thus: "When asked if he can put out his tongue says he can, but he can't"—a terse phrase, the last six words

of which became a favourite expression among some members of his class to describe other conditions where performance did not equal promise. It may be true that sometimes Dr. Walshe's protracted investigation may have proved tiring to a patient or to some so-called "students" who were trying to "catch" a knowledge of medicine as they might perchance have caught measles in the ward, but the patient was always handled with such kindness and delicate consideration by the master that the common impression was one of gratitude for his abundant care, while the earnest worker was always sorry when the last word was uttered and only because there were no more to follow. During this period of constant activity in teaching Dr. Walshe was physician also to the Brompton Hospital for Diseases of the Chest and wrote largely on scientific and practical subjects, with marked learning, skill and acceptance. He translated a "Course of Lectures on the Blood," by Magendie, which were published in THE LANCET, and also the immortal work of Louis, his "Researches on Phthisis." This was brought out in 1844 by the Sydenham Society. In the *British and Foreign Medico-Chirurgical Review* he wrote many critical articles and original papers; one of these is or ought to be familiar to every earnest student—viz., the Report produced in 1849 on Pulmonary Phthisis as observed at the Hospital for Consumption. It is based entirely upon facts recorded statistically, with some forty-four propositions arrived at by strict induction. The most generally interesting of these conclusions and perhaps the most unexpected were those which related to the heredity of phthisis and the laws of hæmoptysis. His small but at the same time exhaustive book on the "Physical Diagnosis of Diseases of the Lungs," published in 1843, was the text-book for students not only in University College but in the other schools of the metropolis. Nothing so compact, so well informed or so precise had appeared before, and although it was expanded afterwards into a much larger book, containing many other aims, it yet remains as a model of condensed knowledge and of perspicacity in its application. His treatise on "Diseases of the Lungs," which grew out of the smaller book just mentioned, has passed into its fourth edition, the last being carefully revised and enriched by the author in 1875. This work has been translated into French and Danish. His other equally important work on "Diseases of the Heart and Great Vessels" also passed to its fourth edition in 1873, and has been deservedly held to be one of the most careful and elaborate epitomes of knowledge on the matters with which it deals.

But Dr. Walshe did much more than these things. He published a "Course of Clinical Lectures," and contributed largely to the journals of the day. He was one of the earliest to furnish an account of "Movable Kidney," 1843, while in 1849 he wrote a remarkable paper in the *Medical Times* on the Logical Application of Physiology to Pathology. In 1862, at the meeting of the British Medical Association in London, he delivered the Address in Medicine, which certainly is one of the ablest among the many very able addresses with which that Association has been honoured. Especial attention should be paid to the very lucid and eloquent passages in which the author, as a scientific witness, throws back upon the legal profession a *tu quoque* reply to the charge of "differences among doctors," as though this were a specialty of their profession. In 1871 he produced a paper in THE LANCET on the fallacy of supposing that "bad health" increases the tendency to catch "acute specific fevers," and other contributions on allied questions teemed from his polished pen. At this time, too, his consulting practice was very large, and he was often seen in courts of law in the great cases of disputed testamentary capacity or of claims for compensation in cases of railway accident. His early legal training made him a most careful and effective witness. In his separately published books and in his numerous lectures and contributions to journals, these things may be fairly said as indications of his originality. He was the first to detail accurately the anatomy of cephalæmatoma and of movable kidney. He was very early in pointing out the influence of existing diathetic diseases on the course of acute specific diseases—e.g., Bright's disease on typhoid fever &c. He was an early, if not the first, exponent of the idea that Bright's disease was not a disease of the kidney but of the blood primarily,<sup>2</sup> a view now so fully illustrated by the

<sup>1</sup> Those distinguished by an asterisk were previously pupils of Dr. Walshe.

<sup>2</sup> THE LANCET, 1840.

into Drs. Basham, Wilson Fox and others that it is really hard to believe how original the idea seemed at the time of its enunciation. He was very strongly of opinion that "the pitch of tone" elicited by percussion was the governing factor in estimating the value of variations in dulness. This may not possibly be so evident to some physicians as it was to the author, whose ear was attuned to the very finest modifications of sound; but the writer, who has made hundreds of observations on this point with Dr. Walshe many years ago is quite sure that the value was not over-estimated by him. As some people are colour-blind more or less, so others have a very indifferent appreciation of changes in the "pitch" of note.

Dr. Walshe was the first to teach in this country the fact of contracted pupil in aneurysm of the arch of the aorta and also the occurrence of sudden death in aortic reflux. These points are fully discussed by him in the fourth edition of his work on Diseases of the Heart and Great Vessels. Dr. Walshe was a Fellow of the Royal College of Physicians of London and LL.D. of Edinburgh, a member of the Medical Society of Observation of Paris, of the Medical Society of Copenhagen, of the Royal Medical Society of Athens and of other learned bodies. The most recent works of Dr. Walshe have been outside medical literature, but both of them have shown wide and accurate knowledge of all the biological principles involved in their curiously interesting and instructive pages. That on "Dramatic Singing Physiologically Estimated" affords a striking illustration of the manner and degree to which a highly cultured physician might find time not only to enjoy but to analyse all the elements that contributed to his enjoyment, and by vast acquaintance with the subject of which he treats to criticise in detail every factor in the production of the musical effects to which he listened. There are few, we think, who could carry out an analysis such as his in the field he has chosen; but still fewer who could, by any possibility, have had either the opportunities he enjoyed or the faculty for understanding what it was he enjoyed, as well as the capacity for its expression. The second book, on "The Colloquial Faculty for Language," with an essay on "The Nature of Genius," is of quite exceptional ability and interest to the scientific biologist and the general reader. To read its pages is to find oneself in companionship with a man of high culture and scientific aim. Dr. Walshe's reading was very wide and exceptionally accurate, and many of his most striking personal qualities are charmingly displayed in this choice and learned work. Pages after pages are full of thoughts and suggestions of recondite or inviting subjects he has left the reader to follow, as his bent may lead him, but all of them convey to the mind the feeling that a great master has passed away and, take him "for all in all, we shall not look upon his like again."

As a physician and consultant Dr. Walshe showed always a fineness of kindly consideration for his patient and his colleague—an outcome of his strong gentleman-like feeling and marked courtesy of manner. To the frankness of his manner, so well known in those of Irish origin, Dr. Walshe added the lustre conferred by a Parisian education and extended travel in the best society. His conversation was enriched by epigram and anecdote and great humour. His acquaintances were many, his intimate personal friends were few; but those who had the advantage of being within that circle always found in him perfect consideration, unflinching and devoted kindness and affectionate personal regard. He was by nature both sceptical and cynical, but to what he did believe he clung with all his energy, and where he did trust he trusted utterly.

To conclude as we began with personal history, Dr. Walshe married, twenty-four years ago, Caroline Ellen, the youngest daughter of the late Rev. D. Baker, Vicar of Bishop's Tawton, and sister of General Sir Thomas Baker, Quartermaster-General of the Forces, by whom he leaves one son, now in his twenty-second year, and who, having just passed his "Responsions," is to follow out his own career in Oxford. Some years ago Dr. Walshe expressed to the writer a wish, recently repented and enforced in a letter directed to be delivered immediately after his death, to the effect how greatly he desired it might be known "how deeply mortified he was by his inability to mix professionally and socially with his colleagues." The "wretched state of his health was the sole but most effective cause of his life of isolation." For years he had "been practically confined to his own fireside not only in the evenings but even in the daytime." This the writer knows to be absolutely true, and knows also

that the isolation, in spite of occasional periods of active practice, dates back for more than twenty years, and was a great source of grief to his old master and friend; Dr. Walshe keenly feared that his former colleagues and associates might think his interest in old studies and pursuits had failed, but it was not really so. To almost the last he retained all his brilliant faculties, and intense interest in pathology and practical medicine, and also in the affairs and ethics of his profession. He was however compelled by painful disease to retire from all the scenes and discussions that would have interested him most deeply, and in which the participators would have found in him a wise and most accomplished adviser, had the discussions been in the Societies, the schools, the councils of his profession, the Colleges or the University. In his charming book on "Dramatic Singing," after quoting Herbert Spencer's homage to the emotional power of the art, couched in the following words: "Music arouses dormant sentiments of which we had not conceived the possibility, and do not know the meaning," Walshe continues, "Spell-bound, in truth, we muse in vague indefinite dreams of something beyond and above this nether world, as melody and harmony of the higher moulds enthrall the auditory sense; in fact a something yet deeper than the shadowing forth or the idealisation of the most trivial and of the deepest emotions, the subtlest and the most refined sentiments, the tenderest and the deepest passions." Feelings and yearnings such as are here expressed are not infrequent in his other writings, nor were they so in his conversation. His was the "Honest Doubt," in which "Faith" lives; although at times its breathing may be faint. He thirsted for perfect knowledge with a passionate longing, and sought no less earnestly for higher light. With Goethe he might say, as we know he often felt, and especially of late,

Und mich ergreift ein längst entwöhntes Sehnen  
Nach jenem stillen, ersten Geisterlich.

And we now, putting all the shadows of life behind us by turning to the light, must feel that such a soul—so fully attuned to every note of melody and every chord of harmony—must, released from its painful tenement in this "nether world," find the reality of its highest aspirations in an exalted condition of existence in some "higher world" of which the philosopher, as such can but "dream."

Sir William Jenner writes: "Many years since I attended Dr. Walshe's lectures on Morbid Anatomy and never heard a more able or clearer lecturer in my life. I followed him in the hospital and he was a first-rate clinical teacher. I heard him deliver an introductory lecture at University College, remarkable for its eloquence and for its soundness. He had left such a strong impression on my mind and I thought so highly of him that when I had the honour to be President of the Royal College of Physicians I wrote to him asking him to deliver the Harveian Oration. Although he at first consented, circumstances soon after prevented him from delivering it."

The following remarks are by a younger contemporary of Dr. Walshe well entitled to speak of his great qualities as a medical teacher and as a physician: "I first made acquaintance with him when he was appointed to the chair at University College by attending his clinique. What the men who talked about him at that time used to say was that 'he had all the characteristics of an Irishman educated in Paris.' He had all an Irish gentleman's geniality and I do not think I ever knew a man who exhibited a more delicate regard for the susceptibilities of all he came into relation with or a finer tact in apprehending them. He was a charming companion largely for these reasons. As a teacher at the bedside he was unsurpassed, and the appreciation of this bedside teaching (after all, the most useful and impressive) was shown by the large numbers of men that accompanied him through the wards at his visits. They all knew perfectly well that they would not come away without very valuable additions to their practical knowledge of disease. But above all, in the wards he was a *trainer*. He recognised this as a most important part of his work at the hospital; he taught the men to be methodical in their diagnosis, never to my recollection quitting the bedside of a fresh case until he had made clear to everyone about him each step that he mentally had taken to arrive at the final view he had adopted. Spreading out the fingers of his hand, I have often seen him in a difficult or obscure case dotting off one by one more or less similar diseases and explaining why one after the other was to be rejected—in fact, teaching the men at the place where they must be most receptive of such teaching the

application of what has been called the 'via exclusionis.' My intercourse with him became renewed in 1852. In that year he began to bring together a few selected men who met periodically at his house under the title of the 'London Medical Society of Observation.' It commenced with somewhere about a dozen men, of whom I recollect Jenner, Sieveking, Hare, Edmund Parkes, Snow Beck, Hermann Weber, Russell Reynolds, Lionel Beale and Morris, besides myself. It never became anything more than a private society of medical workers and never came before the medical public but once, when it put forth a little book, 'What to Observe at the Bedside and after Death in Medical Cases.' It was, as stated in the preface to the volume, 'a form of arrangement of symptoms and after-death appearances which had been framed by Dr. Walshe' and adopted with some modification by the Society. It passed through two editions. How the Society came to an end or what became of its records I cannot tell."

#### DR. GIACOMO RICCHETTI.

VENICE has lost one of her ablest physicians and busiest consultants in Dr. Giacomo Ricchetti, who was found dead in bed on the morning of the 23rd inst. The night before he had retired to rest at the usual hour and seemingly in his usual health. To his servant's customary knock at 7 A.M. next morning no answer was returned, till, on his room being entered, he was seen to be lying as if in sleep. His colleague, Dr. Orazio Pinelli, arrived shortly after, to find him dead from cardiac failure. Dr. Ricchetti was but in his sixtieth year, with apparently a long term of active life before him. He was an exceedingly well trained and pleasant-mannered practitioner and had won great confidence among the Venetian aristocracy and the foreign, particularly the British, residents or visitors in the "Pearl of the Adriatic." By birth he was a native of Gorizia, in the so-called "Italia Irredenta," but like others of his compatriots had become completely naturalised in the city of his adoption—"Italianissimo" (Italian of the Italians).

## Medical News.

UNIVERSITY OF LONDON.—The following candidates have passed the recent M.D. Examination:—

**Medicine.**—Horatio George Adamson, St. Bartholomew's Hospital; Wm. Henry Alchin, Westminster Hospital; Launcelot William Andrews and Harold William C. Aueten, B.S., St. Bartholomew's Hospital; Sir H. Reeve Beever, Bart., King's College; Letitia Caroline Bernard and Frances May D. Berry, London School of Medicine and Royal Free Hospital; Richard Oxley Bowman, Manchester Royal Infirmary; David Brown, B.Sc., London Hospital; Lewis Thos. Fraser Bryett, King's College; G. S. Buchanan, B.S., B.Sc., St. Bartholomew's Hospital; Arthur Wm. Burrell, London Hospital; Frank Geo. Bushnell, University College; Henry Albert Caley,\* St. Mary's Hospital; Julius St. Thomas Clarke, Guy's Hospital; Charles Coles (Gold Medal), St. Bartholomew's Hospital; Walter Stacy Colman, University of Edinburgh and University College, London; Samuel Bird Cook, St. Thomas's Hospital; George Harry Cooke, Owens College and Manchester Royal Infirmary; Harry Corner London Hospital; Henry Jones Curtis, B.S., Philip Rasleigh Dodwell,\* and Douglas Drew, B.S., University College; Henry Holdrich Fisher, St. Bartholomew's Hospital; Arthur Edwd. Giles,\* B.Sc., Owens College; Douglas Richard Green, B.S., and Augustine Griffith, University College; Richard Tanner Hewlett, King's College; Thomas Walter Hinds, University College; Aubrey Dallas P. Hodges, London Hospital; Herbert Horrocks, B.Sc., Owens College and Manchester Royal Infirmary; Edward Victor Hugo, B.S., St. Bartholomew's Hospital; Walter Ross Jordan, Queen's and Mason Colleges, Birmingham; Alfred A. Kanthack, B.S., B.A., B.Sc., Liverpool Royal Infirmary, St. Bartholomew's Hospital and University of Cambridge; Henry Brunton Kitchen and Ronald Edward S. Krohn, University College; Arnold William W. Lea, B.S., Priestley Leech, B.S., and Jas. S. McGowan, B.S., B.Sc., Owens College and Manchester Royal Infirmary; Joseph Johnston Macgregor, St. Bartholomew's Hospital; Charles Pye Oliver, Charing-cross Hospital; John Ernest Paul, University College; Hugh Jas. Moore Playfair, King's College; Harold M. Richards,\* B.S., University College; R. Walter Richards and Llewellyn Roberts, St. Bartholomew's Hospital; Richard Gundry Row, University College; Ernest Alfred Sadler, Birmingham Medical School; Henry Shamm, University College; Gerald A. Simmons, B.S., St. Mary's Hospital; Ernest Newlyn Smith, University College; Cecil Robert Stevens, B.S., St. Bartholomew's Hospital; Thomas Geo. PRESENTATIONS.—Mr. Peter Galloway of Rhynie,, Aberdeenshire, has been presented with a handsome pianoforte, accompanied by a large piece of silver plate, on the occasion of his marriage. Professional duties deprived Mr. Galloway of the pleasurable opportunity of receiving the testimonial in person, and in his absence the duty of receiving the gift devolved on his bride, whilst its acknowledgment was made on his behalf by a friend present.—Mr. H. F. Devis, L.R.C.P. Lond., M.R.C.S., of Bristol, has been the recipient, on the occasion of his marriage, of a handsome marble clock, from the members of the Knowledge Football Club, as a token of respect and friendship.

**THE NEW LANCASTER INFIRMARY.**—The Mayor of Lancaster (Alderman Kitchen) has intimated his intention of subscribing £5000 towards the cost of the new infirmary.

**SELLING DISEASED MEAT.**—The Blackburn bench of magistrates has recognised in a special manner the gravity of the offence of selling diseased meat by inflicting on a butcher a fine of £50 and costs. The evidence went to show that the meat was derived from a cow which had died of fever.

## Notes, Short Comments & Answers to Correspondents.

*It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.*

*Lectures, original articles, and reports should be written on one side only of the paper.*

*Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.*

*We cannot prescribe or recommend practitioners.*

*Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."*

*Letters relating to the publication, sale and advertising departments of THE LANCET to be addressed "To the Publisher."*

*We cannot undertake to return MSS. not used.*

COMMUNICATIONS relating to the EDITORIAL business of THE LANCET must in every case be addressed *exclusively* "To the Editors," and not to them otherwise than in their official capacity.

### PUBLISHER'S NOTICE.

In order to facilitate the work of reference to the volumes of THE LANCET, we have arranged in the future to publish duplicate copies of the Index to each half-yearly volume in a form in which they may be subsequently filed or bound together.

We have had a large number of duplicate copies of the Index to the present half-yearly volume printed, and those of our subscribers who may wish to be supplied with loose copies, can obtain the same (without extra charge) on making application to the Publisher of THE LANCET.

### A GRUESOME "FIND."

AN English mining company the other day in the Alpine commune of Bovegno (Province of Brescia) came upon a shaft, evidently of Roman excavation, across the mouth of which had been laid a wooden beam which, on contact with the air, crumbled immediately into dust. Letting themselves down into the shaft, some of the employes found at the bottom a great number of human skeletons, the osseous framework of men of almost gigantic build, and, not far from these, the entrance to an imperfectly cleared out gallery, in which lay scattered about pieces of a mineral containing silice in combination with lead (*plumbum argentiferum*). This had doubtless been an ancient Roman mine in which the work of excavation had been performed by men of the neighbouring hill tribes, a company of whom had probably been buried alive by a landslip from the mountain above. The skeletons are being carefully preserved for the purpose of checking (possibly confirming) Professor Mosso's recent conclusions as to the comparative strength and stature of men of the Roman epoch and those of the present day.

Dr. J. A. MacFunn (Alderney) writes to ask if any cholera had existed in Cherbourg during the middle or latter end of November and the early part of this month. We believe that the only return as to cholera at Cherbourg related to four deaths towards the end of last month. But, unfortunately, the absence of returns from French ports by no means implies an absence of cholera.

### ANÆSTHETIC ETHER.

To the Editors of THE LANCET.

SIRS,—We are glad to see from your review of Dr. D. W. Buxton's book on Anesthetics that you very properly draw particular attention to the heading of Chap. iv., "Sulphuric Ether—Anæsthetic Ether." These terms have hitherto been only applied to ether obtained by the action of sulphuric acid on spirits of wine or methylated spirit. The introduction of a mixture consisting of amyl hydride and sulphuric ether under either of these names will undoubtedly produce endless confusion; and as this mixture cannot with safety be used as a general anæsthetic, fatal or serious accidents will be the natural result of its substitution for the preparation which has been so long known and used as anæsthetic ether. Amyl hydride is a hydro-carbon, not an ether, and can only be used with safety as a local anæsthetic, whereas the ordinary anæsthetic ether can be employed with equal safety for both local and general anæsthesia. It is therefore absolutely necessary that this mixture should bear some distinguishing name which will prevent the possibility of its being used for general anæsthesia. This, we think, might be done by calling it either "amyl hydride" or "petroleum ether."—We are, Sirs, yours faithfully,  
Edinburgh, Dec. 26th, 1892.

J. F. MACFARLAN AND CO.

### "INFECTION" AND "CONTAGION."

Student.—We are not surprised at our correspondent's difficulty, for the terms as at present used are somewhat ambiguous. It would conduce to clearness if the term "contagion" were restricted to its precise signification of transmission by actual contact; but unfortunately it is often used in connexion with the transmission of specific poisons, aerially or otherwise, and it would be difficult to revert to its true meaning. When a distinction is made between the two terms and a disease is said to be "infectious" and not "contagious," the former term is applied solely to diseases capable of such indirect transmission. Then, again, with the growth of experimental research the phrase "infective" has come to include all affections which are propagated within the body by means of an organised virus, without any reference to their transmission to others. At the same time most, if not all, of the so-called "infective" diseases are capable of being propagated in other bodies by inoculation or the direct introduction into the blood of the virus. Owing to this extended use of the term "infective" it might perhaps be better now to divide all infective diseases into the two groups, "contagious"—using that word in its widest sense—and "inoculable," although the first will probably be found to include many of the second.

### "VESALIUS THE ANATOMIST."

To the Editors of THE LANCET.

SIRS,—Your correspondent "G. M. C." (THE LANCET, Dec. 17th, p. 1424) will, I fear, find it extremely difficult to obtain the information he desires with regard to the domestic or matrimonial life of Vesalius. On these points contemporaneous writers and commentators, as well as later authors, are, so far at least as I have been able to ascertain, singularly reticent or meagre in the details they afford, the chief points thus chronicled being, firstly, those referring to his early devotion to anatomy and the precocity of his eminence therein, as shown by his first work on this subject having been composed in his nineteenth year; secondly, we have a mere outline of the different phases of his strangely varied career as professor of anatomy in Pavia and other Italian universities and as Physician in Ordinary to Charles V. and Philip II. of Spain; and, lastly, in fuller detail has been described the unfortunate misadventure which led to his exile from Spain and pilgrimage to Jerusalem, on returning from which he was shipwrecked at Zanti, where he perished from hunger in 1563. Little more is ascertainable from any of the works I have consulted with reference to the life of Vesalius. One of the most interesting of these in my possession is that published only thirty-three years after Vesalius's death, being a republication of his Anatomy by Paaw—viz., "Andreæ Vesalii, Bruxellensis Epitome Anatomica. Opus Redivivum, cum accipere Notæ ac Commentaria P. Paaw, Amstelædamensis, in Lugduno Batava Academia Professoris Anatomica. Lugdani, Batavorum, 1598." My copy of this somewhat rare work has been most copiously annotated in MS. in 1636 by an evidently English student in the same university—namely, "Guilielmus Perkinus"; and as there is a short sketch of Vesalius's life prefixed I shall, if your correspondent should care to refer to it, be happy to let him see the volume.

I am, Sirs, yours very truly,

THOS. MORE MADDEN.

Dublin, Dec. 21st, 1892.

### GIVING MEDICINE WITHOUT SEEING THE PATIENT.

AT an inquest held in Whitechapel on the death of a man named Moses Van Prazen, aged seventy-eight, it transpired that he had had medicine from a practitioner for two years. Up to that time this gentleman, as medical officer of a medical aid society, attended Prazen at Norton Folgate for bladder and kidney trouble. He then told the friends to let him know if the deceased ever got worse. From that time till they came for a certificate of death he never saw him. The coroner did not reflect on the medical man and thought the only thing he could have done was to have refused a certificate. It speaks much for the medicine that it served in a serious case for two years and a half; but it is certainly unsatisfactory in any case to give medicine continuously without occasionally seeing the patient.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

During the week marked copies of the following newspapers have been received:—*Birmingham Daily Post, Local Society's Health, Electrical Engineer, Galignan's Messenger, Schoolmaster, Home News, Southern Echo (Southampton), Kentish Express, Kelso Mail, Working News, Caterer, Scientific American, Irish News, Optician, Belfast Evening Telegraph, Cork Constitution, Trade and Finance, Family Doctor, Louth Times, Brighouse Echo, Surrey Times, Jarrow Express, Dundee Courier, Public Opinion, Waterford Mirror, Figaro, Weekly Free Press and Aberdeen Herald, Local Government Chronicle, City Press, Leeds Mercury, Yorkshire Post, Liverpool Daily Post, Bristol Mercury, Hertfordshire Mercury, Mining Journal, Reading Mercury, Hastings Independent, Bath Chronicle, West Sussex Gazette, Western Daily Press, Manchester Courier, South Australian Register, Madras Times, Surrey Advertiser, Local Government Journal, West Middlesex Advertiser, Citizen, Sunday Times, Builder, Architect, Times of India, Pioneer Mail, Kentish Express, Scotsman.*

Communications, Letters &c. have been received from—

The Publisher cannot hold himself responsible for the return of testimonials &c. sent to the office in reply to advertisements; copies only should be forwarded.

NOTICE.—Advertisers are requested to observe that it is contrary to the Postal Regulations to receive at Post Offices letters addressed to initials only.

An original and novel feature of "THE LANCET General Advertiser" is a special Index to Advertisements on pages 2 and 4, which not only affords a ready means of finding any notice, but is in itself an additional advertisement.

Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance.

Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET.

Terms for Serial Insertions may be obtained of the Publisher, to whom all letters relating to Advertisements or Subscriptions should be addressed.

THE LANCET can be obtained at all Messrs. W. H. Smith and Son's Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Agent for the Advertisement Department in France—J. ASTIER, 66, Rue Caumartin, Paris.

## MEDICAL SOCIETIES.

ANATOMICAL SOCIETY OF GREAT BRITAIN AND IRELAND—Annual general meeting; Exhibition of specimens, 1883  
 BRADFORD MEDICO-CHIRURGICAL SOCIETY.—President's address, 833—Cholera in Hamburg, 1102—Exhibition of a case and specimens, 1444

CLINICAL SOCIETY.—Intestinal obstruction accompanied by thrombus in the abdominal aorta extending down the iliac vessels; Extensive movus of peritoneum; Traumatic external iliac aneurysm in a boy; Cicatricial stricture of œsophagus treated by complete division, 940—Macrocheilia treated by electrolysis; Subcutaneous suture of patella; Transverse fracture of patella; Raynaud's disease; Amputation of arm for lymphatic œdema in cases of breast cancer; Congenital deficiency of a portion of chest-wall; Sinus in loin connected with posterior mediastinal abscess; Sarcoma of skin; Complete erosion of ankle-joint, 1040—Sequel to a case of tuberculous peritonitis; Hyperplastic phlebitis; Lumbar nephro-lithotomy; Double empyema, 1163—Rhythmic rocking movement in children; Extensive fracture of superior maxilla; Pernicious œmia; Cranial cyst; Movable body in elbow-joint; Congenital amputation of forearm; Extensive unilateral nevus; Pancreatic cyst; Excision of cancerous stricture of small intestine, 1273—Subacute pulmonary œdema occurring above a diminishing pleural effusion; Excision of a wandering spleen for axial rotation; Hemiplegia in typhoid fever; Fracture of lower jaw with traumatic aneurysm, 1386

DEVON AND EXETER MEDICO-CHIRURGICAL SOCIETY.—Opening meeting, 906

EDINBURGH MEDICO-CHIRURGICAL SOCIETY.—Discussion on pernicious œmia and its treatment by transfusion, 23

EPIDEMIOLOGICAL SOCIETY.—Tuberculosis as an endemic disease, 1330

FORFAIRSHIRE MEDICAL ASSOCIATION.—Abscess of spleen; Eclampsia; Thrombosis of basilar artery, 333

GLASGOW OBSTETRICAL AND GYNÆCOLOGICAL SOCIETY.—Notes of 1023 confinement cases, 1276

HARVEIAN SOCIETY.—Peritonitis, 1167—Rodent ulcer; Dermatitis herpetiformis; Exhibition of a clinical pulse manometer; Treatment of (so-called) impassable urethral stricture, 1339

HUNTERIAN SOCIETY.—Phtisis in relation to life assurance, 1167—Exhibition of two cases of myxœdema; Urticaria, 1330—Influence of protozoa in certain diseased conditions; Fibroid degeneration, 1442

ISLINGTON MEDICAL SOCIETY.—The radical cure of hernia, 1163

LEICESTER MEDICAL SOCIETY.—Arsenic as a prophylactic, 1274

LIVERPOOL MEDICAL INSTITUTION.—Exhibition of cases, 1443

MANCHESTER MEDICAL SOCIETY.—Exhibition of cases, 1103, 1444

MANCHESTER PATHOLOGICAL SOCIETY.—Exhibition of specimens, 1274, 1444—Excision of the auditory ossicles in cases of chronic suppurative middle-ear disease, 1275

MEDICAL SOCIETY OF LONDON.—Presidential address, 938—Traumatic volvulus of small intestine treated by abdominal section; The treatment of the peritoneum in abdominal surgery, 995—Intra-thoracic auscultation; Surgical treatment of cysts of the vulvo-vaginal or Cowper's glands, 1047—Tubal moles and tubal abortion, 1101—Old dislocation of ankle; Tuberculous ulceration of pharynx treated by lactic acid; Left inguinal colotomy; Urticaria pigmentosa; "Caisson" work in bladder surgery; Radical cure of hernia; Pelvic bony tumour associated with osteo-arthritis of hip; Leprosy improved under treatment; Fusiform carotid aneurysm; Cystic tumour of auricle; Ulceration of ears, 1162—Syphilis and nervous disease in children, 1221—Athletic exercise as a cause of disease of the heart and aorta; Selection of methods of treatment in hemorrhoids, 1272—Cholera, 1331—The irregular heart, 1335

MIDLAND MEDICAL SOCIETY.—Exhibition of cases and specimens, 1103, 1444—Dropped foot from sciatic neuritis, 1444

NORTHUMBERLAND AND DURHAM MEDICAL SOCIETY.—Exhibition of cases, 1275, 1445—A ready method for the detection and estimation of free hydrochloric acid in the contents of the stomach, 1445

NORWICH MEDICO-CHIRURGICAL SOCIETY.—Retrospective address, 1103

NOTTINGHAM MEDICO-CHIRURGICAL SOCIETY.—Vivisection, is it justifiable? 1275—Reducible hernia; Exhibition of specimens; Myxœdema; Tubercular tendo-vaginitis, 1445

OBSTETRICAL SOCIETY.—On menstruation in cases of backward displacement of the uterus, 199—Value of abdominal section in certain cases of pelvic peritonitis, 831—Adjourned discussion on abdominal section in pelvic peritonitis, 1164—Sugar in the urine during the puerperal state, 1442

OPHTHALMOLOGICAL SOCIETY.—Detachment of the choroidæ; Recurrent keratitis superficialis punctata; Changes in the Retina due to the contact of a metallic chip; Double optic neuritis after influenza, 22—Implantation cyst of the iris after cataract extraction; Accidental vaccinia of the eyelids; Symmetrical dacryo-adenitis, 109—Congenital defects of the iris and glaucoma; Neuro-retinitis following influenza; Optical condition of fifty persons complaining of no ocular disturbance, 995—Conjunctivitis set up by flies; Hyperplastic subconjunctivitis; Intra-ocular injection of antiseptic solutions; Intra-ocular absorption of iodoform, 1166—Kerato-malacia in young children; Panophthalmitis following lacrimal abscess; Probable rupture of the optic nerve, 1337

PATHOLOGICAL SOCIETY.—Myxœdema treated by injections of thyroid juice; "Fat necrosis" associated with disease of pancreas; Congenital cystic disease of the scrotum; Hepatic cirrhosis from cardiac valvular disease; Unstriated myoma of penis; Fibrous plaque from penis; Specimens illustrating parasitæ of malignant disease, 941—Traumatic epithelial cyst of hand; Adenoma of soft palate; Parasitic cysts from rabbit; Acute traumatic and respiratory emphysema of lung; Right-sided ulcerative endocarditis of heart; Atlo-axoid disease, 1048—Special general meeting; Epithelioma on the legs of a fowl; Genito-urinary organs of a pseudo-hermaphrodite, 1164—Myxoma of humerus undergoing chondrification; Fibroma of male breast; Chronic mastitis of male breast; Hyaline fibroma of cow's udder; Fatty tumour from lip; Histology of yaws; Sarcoma of sterno-mastoid, 1332—Lingual ulcer; Infantile adrenal disease; Papilloma of penis; Hemorrhage into pericardium; Renal sarcoma spreading down ureter; Psoriasis and squamous epithelioma; Ulceration of arm following vaccination in hereditary syphilis, 1495

PLYMOUTH MEDICAL SOCIETY.—Exhibition of cases and specimens, 1102, 1276, 1445, 1446—Connection in disease between distant organs not known to be related in health, 1445

ROYAL ACADEMY OF MEDICINE IN IRELAND.—Traumatic malignancy; Actinomycosis; Aneurysm of aorta; "Walking" typhoid fever; Typhoid bacillus; Estlander's thoracoplastic operation; Lead poisoning, 1333

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.—Amputation for diabetic gangrene, 904—Amputation through thigh, preliminary to, or in place of, amputation through hip in advanced cases of hip disease, 1100—Hepatic abscess bursting into peritoneum treated by incision and flushing; Radical treatment of severe talipes equinus in children, 1220—Supra-vaginal amputation of cervix uteri for cancer, 1334

SHEFFIELD MEDICO-CHIRURGICAL SOCIETY.—Exhibition of cases and specimens, 1102, 1446—Anæsthetics, 1276—Etiology of acute Bright's disease; Diarrhœa in advanced phthisis; Flat-foot, 1440

SOCIETY OF MEDICAL OFFICERS OF HEALTH.—President's inaugural address, 1300

SOCIETY OF MEDICAL OFFICERS OF HEALTH (NORTH-WESTERN BRANCH).—Compulsory isolation of certain diseases, 1440

TORQUAY MEDICAL SOCIETY.—Exhibition of cases; Pernicious œmia, 834—Recent experiences in sanitary matters; Pyralism of neurotic origin associated with bilateral deafness and dyspepsia, 906

WEST LONDON MEDICO-CHIRURGICAL SOCIETY.—Presidential address, 833—Gall-stones, their origin, nature and treatment; Prevention of suicide in the insane, 1163—Exhibition of cases, 1300

Medical students, the legality of acting as assistants, 205; anthropology for, 453; address to, 519; class guide, 609  
 —, study, anatomy as a science, and in relation to, 923, 932  
 —, teachers, 509

MEDICAL TRIALS.—Medical Battery Company v. Jeffery, 224—Macdonald v. Turner, 235—Allinson v. General Medical Council, 291, 401—Apothecaries Society v. C. Jones, 402—Prosecution of druggists, tincture of opium

or laudanum? 402—Medical men and the new Public Health Act, 403

Medical witnesses, compensation to, 517

#### MIRROR OF HOSPITAL PRACTICE, BRITISH AND FOREIGN.

ANCOATS HOSPITAL, MANCHESTER.—Three cases of compound depressed fracture of the skull treated by elevation and reimplantation of fragments, and without the use of the drainage tube, 1329

BIRMINGHAM GENERAL HOSPITAL.—A series of cases of congenital malformation of the large intestine; remarks, 257, 310

BRISTOL GENERAL HOSPITAL.—A case of dislocated calcareous lens causing sympathetic irritation; excision, 603—Two cases of abdominal section, 836

BURTON-ON-TRENT INFIRMARY.—A case of intestinal obstruction with peculiar features, 22

DENBIGH INFIRMARY.—Subcutaneous laceration of the small intestine; necropsy, 937

DEVON AND EXETER HOSPITAL.—Compound depressed fracture of skull, laceration of brain; operation; recovery, 485

EASTERN FEVER HOSPITAL.—Two cases of glanders, 719

GOONA HOSPITAL, INDIA.—Abscess of the liver; operation; recovery, 423

GREAT NORTHERN CENTRAL HOSPITAL.—A case of tetanus, with prolonged lockjaw, successfully treated by chloral and chloroform, 718—Collapse after ovariectomy; transfusion; recovery, 1210

KING'S COLLEGE HOSPITAL.—Retro-pharyngeal abscess in a child; tracheotomy; incision; recovery, 483

LANCASHIRE COUNTY ASYLUM, RAINHILL.—A case of fatal coma of unexplained origin, 1210.—Case of glioma of the corpus striatum (lenticular nucleus) with melancholic symptoms, ending in unilateral convulsions with hyperpyrexia, 1493

LIVERPOOL ROYAL INFIRMARY.—Post-pharyngeal abscess; asphyxia; laryngotomy; recovery, 841

LONDON HOSPITAL.—Two cases of perineal prostatictomy, 142—A case of contracted knee treated by tenotomy by the open method, 1161—Phosphorus necrosis of the upper jaw; chronic abscess of the brain, 1439

MANCHESTER ROYAL INFIRMARY.—Acute intestinal obstruction due to band operation; recovery, 143—A case illustrating the treatment of fecal fistula after typhlitis, 835

METROPOLITAN HOSPITAL.—A case of catalepsy in a patient with general tuberculosis, 610—Compound depressed fracture of the skull; trephining; replantation of bone; complete closure of the wound; recovery, 992—Ulcerative endocarditis; cerebral hæmorrhage; death, 1003

MIDDLESEX HOSPITAL.—Two surgical cases, 147—A case of suicidal wound of the throat completely severing the larynx and opening the gullet; suturing of each; survival during several hours, 421—Case of multiple visceral injuries occasioned by a crush, with trivial marks of violence on the surface of the body, 1492

MORPETH DISPENSARY.—Case of acute yellow atrophy of the liver; necropsy, 422

NEWCASTLE-ON-TYNE CHILDREN'S HOSPITAL.—Dermoid cyst of ovary in a child seven years and a half old; successful removal, 611

NEWCASTLE-ON-TYNE ROYAL INFIRMARY.—Case of aortic, mitral and tricuspid stenosis, 611—Case of fractured humerus with injury to the musculo-spiral nerve, 1161

NORFOLK AND NORWICH HOSPITAL.—A case of nephrectomy for carcinoma, 1003

NORTH-EASTERN HOSPITAL FOR CHILDREN.—Ileo-cæcal intussusception; injection of water; laparotomy; recovery, 830

NORTH RIDING INFIRMARY.—Pneumothorax; tumour (fibro-adenoma) of the male mamma, 368—A case of urinary calculus, the nucleus being formed of a lead pencil guard; lateral lithotomy; recovery, 481

ROYAL FREE HOSPITAL.—Primary tuberculous ulceration of large intestine, 367—A case of chronic pyæmia; recovery, 1271

ROYAL PORTSMOUTH HOSPITAL.—A case of hydatids of the liver; recovery, 1271

ST. BARTHOLOMEW'S HOSPITAL.—Case of hysterical paralysis of the abductors of the larynx and of the diaphragm, associated with peculiar movements of the palate, 309—Osteo-sarcoma of the humerus weighing thirty-three pounds and measuring thirty-one inches in circumference; ligature at the sub-clavian artery and amputation at the shoulder joint; recovery, 602

ST. MARY'S HOSPITAL.—Twisted spermatic cord and gangrene of testis; remarks, 257—Traumatic peritonitis; abdominal section; recovery, 936

ST. THOMAS'S HOSPITAL.—Cases illustrating the treatment of recurrent pelvic peritonitis by abdominal section; remarks, 20, 83—Two cases of rotatory dislocation of the patella, 774—Inguinal aneurysm treated by ligature of the external iliac artery by the intra-peritoneal method, 1328

SHEFFIELD PUBLIC HOSPITAL AND DISPENSARY.—Three surgical cases, 1440

SKYE GESTO HOSPITAL.—A case illustrating the successful treatment of internal hæmorrhoids by chrysoarobin, 938

SOUTH DEVON AND EAST CORNWALL HOSPITAL, PLYMOUTH.—Two instructive renal cases, 30—Coccydynia; excision of coccyx, 1046

SUNDERLAND INFIRMARY.—Two cases of vaginal hysterectomy for cancer; recovery, 993

TORBAY HOSPITAL, TORQUAY.—A case of impacted calculus behind a stricture of the urethra; retention and extravasation of urine; operation; recovery, 1330

UNIVERSITY COLLEGE HOSPITAL.—Two cases of exostosis involving joints; removal through the joints; complete relief, 1383

VICTORIA HOSPITAL, HULL.—Osteo-myelitis of tibia; resection; multiple (septic) epiphysitis, 775

WESTMINSTER HOSPITAL.—Spura-public cystotomy for calculus, 1045

Missed abortion, 306

—birth in animals, 406

Missions, the forward movement in, 1053

Mist bismuth oxychlor. o. pepsina, 1026

Model lodging-houses, 1457

Molar, six-year-old, a plea for the, 950

Moleschott's jubilee, 1058, 1453, 1469

Mona McLean, Medical Student (review), 1894

Monte Carlo, exclusion of medical men from, 1230

Moon, Mr. H., obituary notice of, 1253

(For Index to Trade and Miscellaneous Advertisements see page 4.)

# J. & A. CHURCHILL, PUBLISHERS.

Sixth Edition, with Engravings, fcap. 8vo, 9s.

## STUDENT'S GUIDE TO THE PRACTICE OF MEDICINE.

By M. CHARTERIS, M.D.,

Professor of Therapeutics and Materia Medica in the Glasgow University.

"A vast amount of information, well arranged and accurately expressed."—THE LANCET.

Now ready, Second Edition, with 8 Plates and 31 Wood Engravings, 8vo, 6s. 6d.

**On Contractions of the Fingers**  
(Dupuytren's and Congenital Contractions): their Treatment by Subcutaneous Divisions of the Fascia and Immediate Extension.

Also, on

**Hammer-Toe; its Curability by Subcutaneous Division of the Lateral Ligaments and Immediate Extension.** Also, on

**The Obliteration of Depressed CICATRICES by a SUBCUTANEOUS OPERATION.**

By WILLIAM ADAMS, F.R.C.S.,

Consulting Surgeon to the Great Northern Central Hospital, to the National Hospital for the Paralysed and Epileptic, and to the National Orthopedic Hospital.

**Electric Illumination of the Bladder**  
and URETHRA as a MEANS OF DIAGNOSIS OF OBSCURE VESICO-URETHRAL DISEASES. By E. HURRY FENWICK, F.R.C.S., Surgeon to St. Peter's Hospital for Stone and Urinary Diseases, Surgeon to the London Hospital. Second Edition, with 50 Engravings, 8vo, 6s. 6d.

"The surgery of the bladder has made such rapid strides in the last few years that a knowledge of this work becomes a necessity to every scientific and progressive surgeon."—BRIT. MED. JOUR.

"A valuable monograph on a most interesting and important subject."—LONDON MEDICAL RECORDER.

**Uric Acid as a Factor in the CAUSATION OF DISEASE;** a Contribution to the Pathology of High Arterial Tension, Headache, Epilepsy, Mental Depression, Gout, Rheumatism, Diabetes, Bright's Disease, and other Disorders. By ALEXANDER HAIG, M.D., F.R.C.P., Physician to the Metropolitan Hospital and the Royal Hospital for Children and Women. With 28 Illustrations, 8vo, 8s. 6d.

By TOM ROBINSON, M.D.

**Illustrations of Diseases of the Skin**  
and SYPHILIS. Fas. I., 3 Coloured Plates, with Remarks, imp. 4to, 5s.

**On Eczema; its Etiology, Pathology, and TREATMENT.** Crown 8vo, 8s. 6d.

**The Diagnosis and Treatment of SYPHILIS.** Crown 8vo, 8s. 6d.

**The Surgery of the Rectum; with**

Cases illustrating the Treatment of Hæmorrhoids and Prolapsus by the Improved Clamp. (Lettsoman Lectures.) By HENRY SMITH, F.R.C.S., Emeritus Professor of Surgery in King's College, and Consulting Surgeon to King's College Hospital. Fifth Edition, 8vo, 6s.

"It is unnecessary to make an extended notice of a book so well known, by an author who is looked upon as the chief authority on diseases of the rectum."—EDIN. MED. JOUR.

**DISEASES OF THE RECTUM & ANUS.**

By ALFRED COOPER, F.R.C.S.,

Senior Surgeon to St. Mark's Hospital for Fistula; and

F. SWINFORD EDWARDS, F.R.C.S.,

Surgeon to the West London and St. Peter's Hospitals, and Senior Assistant Surgeon to St. Mark's Hospital.

Second Edition, Illustrated and much enlarged, 8vo, 12s.

"This will prove itself one of the most complete and useful of recent treatises on this special subject. . . . The book is well illustrated by plates and engravings—most of which are original."—BRITISH MEDICAL JOURNAL.

"We can most cordially recommend the book to the general practitioner and to the specialist in this department of surgery, with the full assurance that the authors have produced in this edition a work which is thoroughly abreast of the time and one of the very best with which we are acquainted."—DUBLIN JOUR. MED. SCI.

**The Treatment of Internal Derangements of the KNEE-JOINT by OPERATION.** By HERBERT W. ALLINGHAM, F.R.C.S., Surgeon to the Great Northern Central Hospital, Assistant Surgeon to St. Mark's Hospital for Fistula. With Engravings, 8vo, 5s.

**Allingham on Diseases of the Rectum.**

Edited and Revised, with much additional New Matter, by HERBERT WILLIAM ALLINGHAM, F.R.C.S. Eng., Surgeon to the Great Northern Central Hospital, Assistant Surgeon to St. Mark's Hospital for Fistula, &c. Fifth Edition, with 58 Engravings, 8vo, 10s. 6d.

**Differentiation in Rheumatic Dis-**

**EASES.** By HUGH LANE, Surgeon to the Royal Mineral Water Hospital, Bath, and Hon. Medical Officer to the Royal United Hospital, Bath. Second Edition, much enlarged, with 8 Plates, crown 8vo, 8s. 6d.

"It is written in a purely practical spirit, and points out with success the leading features of chronic rheumatism, rheumatoid arthritis and gout, besides discussing with commendable detail the main lines of treatment of a class of painful affections which so often defy our powers in this direction."—THE LANCET.

"We like Mr. Lane's book and recommend it."—DUB. JOUR. MED. SCI.

**The Ophthalmoscope: a Manual for**

Students. By GUSTAVUS HARTRIDGE, F.R.C.S., Surgeon to the Royal Westminster Ophthalmic Hospital. With 68 Woodcuts and 2 Coloured Plates, crown 8vo, 4s.

By the same Author,

**The Refraction of the Eye.** Sixth

Edition, with 98 Illustrations, crown 8vo, 6s.

**Fenwick's Outlines of Medical Treat-**

**MENT,** including Foreign as well as English Methods. Third Edition, much Enlarged, crown 8vo, 10s.

"It cannot fail to be most useful on the table or in the carriage of every busy practitioner."—THE LANCET.

"Whoever will take the trouble to read the book and to follow its plain and thoroughly practical directions will be a safe and sound practitioner."—PRACTITIONER.

**Fenwick's Student's Guide to Medical**

**DIAGNOSIS.** Seventh Edition, with 117 Engravings, fcap. 8vo, 7s.

**On some of the Mental Affections of**

**CHILDHOOD and YOUTH;** being the Lettsoman Lectures delivered before the Medical Society of London in 1887; together with other Papers. By J. LANGDON DOWN, M.D., F.R.C.P., Consulting Physician to the London Hospital. Post 8vo, 6s.

"Dr. Down shows a happy talent for presenting the main facts and avoiding immaterial details."—LONDON MEDICAL RECORD.

"A series of essays which will henceforth occupy a place of the first importance in the literature of the subject."—THE PRACTITIONER.

**By Bernard E. Brodhurst, F.R.C.S.,**

Surgeon to the Royal Orthopedic Hospital:—

**Lectures on Orthopedic Surgery.**

Second Edition, with Engravings, 8vo, 12s. 6d.

**Curvatures and Disease of the Spine.**

Fourth Edition, with Engravings, 8vo, 7s. 6d.

 Harvey and his Successors.—The HARVEIAN ORATION, delivered at the Royal College of Physicians, October 18th, 1892. By J. H. BRIDGES, M.B., F.R.C.P., sometime Fellow of Oriel College, Oxford. Crown 8vo, paper covers, 1s. Macmillan & Co., London.

Now ready, Fourth Edition, up to date.  
**PRACTITIONER'S HANDBOOK OF DISEASES OF THE EAR AND NASO-PHARYNX.**  
 By MACNAUGHTON JONES and W. R. H. STEWART.  
 "One of the best examples of dual authorship we remember to have seen for some time past in medical literature."—MED. PRESS AND CIR.  
 With Coloured Plates and 162 Woodcuts (cloth, 892 pp.). Price 10s. 6d. London: Baillière, Tindall, & Cox.

Now Ready, SECOND EDITION, Revised and Enlarged, crown 8vo, 5s.  
 On the PRINCIPLES and EXACT CONDITIONS to be OBSERVED in the ARTIFICIAL FEEDING of INFANTS; the Properties of Artificial Foods; and the Diseases which arise from faults of Diet in Early Life.  
 By W. B. CHEADLE, M.A., M.D. Cantab., F.R.C.P.; Physician to St. Mary's Hospital; Consulting Physician to the Hospital for Sick Children, &c.  
 London: Smith, Elder & Co., 15, Waterloo-place.

Now ready, Fourth Edition, Enlarged, with Coloured Plates, price 12s. 6d.  
**Diseases of the Ear.** By George P. FIELD, M.R.C.S., Aural Surgeon to St. Mary's Hospital and Lecturer on Aural Surgery and Dean of the Medical School.  
 "Very practical and helpful."—THE LANCET.  
 "Forms an excellent guide for the practitioner or the student."—BRITISH MEDICAL JOURNAL.  
 "It is a practical treatise founded on vast clinical experience. The illustrations are excellent and helpful, the text is clear and concise, and the work as a whole is as complete and trustworthy as we could desire. We recommend it strongly to practitioners and students alike."—MEDICAL PRESS AND CIRCULAR.  
 "It contains a novel feature. A number of plates are given on thick cardboard, the spot where the membrane tympani ought to be seen is perforated, and a coloured representation of the drum is pasted on behind. If the membrane be looked at through a speculum a more correct idea than any heretofore given will be the result."—MEDICAL TIMES AND GAZETTE.  
 London: Baillière, Tindall & Co.

Fifth Edition, Revised and Enlarged, price 6s.  
**A Handbook on Diseases of the Skin,** with especial reference to DIAGNOSIS and TREATMENT.

New and Second Edition.

A TREATISE ON  
**DISEASES**  
OF  
**THE NOSE**

With much additional matter, in One Volume, post 8vo, with Chromolithographs and over Sixty Illustrations, &c., price 10s. 6d.

By **GREVILLE MACDONALD,**  
M.D. Lond.,

Physician to the Throat Hospital, Golden-square, W.

"It is distinctly an advantage to have an opportunity of studying the methods of diagnosis and of treatment which are followed by one who has had great facilities of working at this subject. . . . The book literally bristles with practical hints which can be applied by all who are willing to devote the time to acquire sufficient dexterity."

THE LANCET, June, 1892.

"We consider the work a most complete and thoroughly practical account of the present state of rhinology."

LIVERPOOL MEDICO-CHIRURGICAL JOURNAL, July, 1892.

"The volume is full of valuable and reliable practical information; and this may be read with profit not only by the general practitioner but by specialists in laryngeal and nasal surgery."

GLASGOW MEDICAL JOURNAL.

"One of the best text-books in the English language."

MEDICAL PRESS, June, 1892.

"... His composition is so enticing that one finds himself in the midst of the work and in possession of accurate and carefully sifted information without effort."

PHILADELPHIA MEDICAL AND SURGICAL REPORTER, June, 1892.

A. P. WATT, 2, Paternoster-square, E. C.

NOW READY, profusely Illustrated, price 10s. 6d.

A GUIDE TO THE SELECTION AND  
ADAPTATION OF  
**ORTHOPÆDIC APPARATUS.**

With a Detailed Description of their Salient Points.

By **F. GUSTAV ERNST,**  
Orthopædic Mechanician.

"The illustrations of this work are excellent. The descriptions of the instruments are also good."—THE LANCET.

"... We cannot but admire the ingenuity and skill shown in the instruments illustrated. Gentlemen who make a speciality of correcting deformities of the limbs or trunk will find the book a useful one for reference on the subject of apparatus."—MEDICAL PRESS.

"... It is manifest, from the cleverly designed apparatus illustrated and explained in this book, that Mr. Ernst is a thorough master of his vocation; and surgeons who may require mechanical support for their patients might consult Mr. Ernst's 'Guide' with great profit."—THE HOSPITAL GAZETTE.

SPRAGUE & Co., 22, Martin's-lane, Cannon-street, E. C.

By **HARRISON CRIPPS,**  
Assistant Surgeon to St. Bartholomew's Hospital.

H. Renshaw, 850, Strand, W.C.

MESSRS. CASSELL & COMPANY have the pleasure to announce that they have arranged with the University of Pennsylvania Press to publish in Great Britain, IN MONTHLY PARTS, PRICE 2s.,

AN ENLARGED SERIES OF THE

# ANNALS OF SURGERY:

A MONTHLY REVIEW OF SURGICAL SCIENCE AND PRACTICE. Edited by

FREDERICK TREVES, F.R.C.S. (of London); WILLIAM MACEWEN, M.D. (of Glasgow);  
L. S. PILCHER, A.M., M.D. (of Brooklyn, U.S.A.); J. WILLIAM WHITE, M.D. (of Philadelphia, U.S.A.).

PART I., NEW SERIES, ready early in JANUARY.

ANNALS OF SURGERY is the only high-class Journal published in the English language devoted exclusively to presenting current work in the science and art of surgery. The names of its editors are a sufficient guarantee for the sterling character of its contents. The high standard which has been attained in the past will be fully maintained in the future, and the Journal in its new form should command the support of all those to whom it appeals.

A subscription of One Guinea, paid in advance, will secure the Journal post free for one year. \* \* \* A prospectus will be sent post free on application.

CASSELL & COMPANY, LIMITED, LUDGATE HILL, LONDON.

NINTH YEAR OF ISSUE. Ready early in January, price 7s. 6d.

# THE YEAR-BOOK OF TREATMENT FOR 1893.

A CRITICAL REVIEW FOR PRACTITIONERS OF MEDICINE & SURGERY.

Crown 8vo, about 500 pages, cloth.

"The whole volume is full of good things and will prove a great boon to the busy practitioner. . . . It is a BOOK OF EXTREME VALUE to all who in these busy times find it difficult to keep pace with the ever-advancing march of the science and art of medicine."—THE LANCET.

CASSELL & COMPANY, LIMITED, LUDGATE HILL, LONDON.

THE NEW VOLUME IS NOW READY, price 6s. 6d. (Vol. 100).

# BRAITHWAITE'S RETROSPECT, JAN., 1893.

A RECORD OF THE PROGRESS OF THE MEDICAL SCIENCES FOR THE PAST SIX MONTHS.

With an ALPHABETICAL SYNOPSIS of MEDICAL and SURGICAL TREATMENT.

"In spite of younger rivals, it still holds its own as the book for the medical practitioner." "It is a work which the inquiring practitioner will find of the utmost value."—EDINBURGH MED. JOURNAL. "Braithwaite's Retrospect' has become a medical household word."—ASCLEPIAD. "From the time when I first opened Bell's Anatomy to that in which I closed my Sharpey and Quin and my 'Braithwaite' they marked the progress of my studies, and stood before me as the stopping-stones of my professional life."—DR. OLIVER WENDELL HOLMES.

London: SIMPKIN, MARSHALL, HAMILTON, KENT & CO. Edinburgh: OLIVER & BOYD. Dublin: HODGES, FIGGS & CO.

(A FEW DOORS FROM THE LANCET OFFICE.)

**REVOLUTION IN TEA MAKING!**

Extracting THEINE, NOT the TANNIN.

A beverage now produced from Tea hitherto unknown to the Tea-drinking World.

THE ONLY TEAPOT THAT SEPARATES THE STALKS CONTAINING THE TANNIC ACID FROM THE LEAVES WHILE INFUSING.

WILSON'S PATENT NON-TANNIC TEAPOT will make tea clear, the colour of amber, perfectly free from dirt or leaves, clean to the palate, and free from dyspeptic acid.

How is this done? The Teapot is the ordinary shape that is found in every household; it has two containers—the outer holding boiling water, which heats the inner cylinder containing the dry leaves lying in the cage, which makes the tea hot before infusion. The boiling water being now thrown on the tea, which mixes freely with the water, the leaves will be found equally distributed in the Cylinder (in the old system it lies in a body at the bottom and is cold). Three minutes is allowed for infusion, when all the invigorating properties are extracted; the leaves are now drawn up from the infusion before they can throw off the tannic acid they contain.

# CADBURY'S COCOA

## ABSOLUTELY PURE, THEREFORE BEST.

THE Manufacturers of this Preparation of Cocoa claim that it is absolutely pure, and that it has no superior in the market as far as wholesomeness, purity, economy, and agreeableness go. Many of the Dutch Cocoas with which the English market is flooded are preparations of Cocoa combined with strong and injurious alkalies; while they are not so cheap as they are represented to be, because, when mixed with water, they give, in plain English, a soap, the alkalies helping to give an appearance of fictitious strength. CADBURY BROTHERS earnestly appeal to the Medical Profession to discountenance the use of these foreign, adulterated, perfumed Cocoas, and to encourage the consumption of pure home-made preparations, like their Cocoa Essence, which has received the unqualified support of large numbers of eminent Physicians and Surgeons.

NET TO THE PROFESSION ONLY. — (Better qualities are made when required.)

In Mr. HOLTHOUSE'S work on "Trusses" occurs the following passage:—

"I was consulted by a Medical Man some two years ago respecting an oblique Inguinal Hernia which caused him great suffering, and which he had not been able to keep up by any of the various Trusses which he had tried. I recommended him a Coles, but with no better result. On the 28th of March of the present year I received a letter from him giving details of numerous trials and disappointments he had experienced since he consulted me. 'In this lamentable state of matters,' he continues, 'I applied to Mr. Huxley, in Old Cavendish-street, who has sent me a Truss which answers perfectly well in keeping the rupture up, and is also extremely comfortable, giving me such a feeling of support and safety that I would not hesitate to ride to hounds. I can walk ten miles easily with Huxley's Truss without a tithe of the inconvenience of even Lindsey's Truss, which was previously the only one I dare wear. . . . I thought you would like my experience in Trusses in my own case, and that you would be glad to learn that I can now do my work with little or no inconvenience.'—Vide "On the Proper Selection and Scientific Application of Trusses," by CARSTEN HOLTHOUSE, F.R.C.S., Senior Surgeon to, and Lecturer on Clinical Surgery at, the Westminster Hospital. (J. & A. Churchill, New Burlington-st.)

E. HUXLEY begs to draw the attention of the Profession to a greatly improved method of treating difficult cases of Scrotal and Femoral Hernia.

**HUXLEY'S SUPPORT FOR INJURY TO THE LARGE MUSCLE OF THE THIGH—(Rider's Sprain).**

Until this contrivance was devised, the straining of the adductor muscles, a most common accident to hunting men, had met with no effectual remedy. I, like others, had failed in keeping up a pressure on the part, the compression of which could alone relieve, owing to the tendency of everything fitted to the thigh to run down. I am pleased to say I have most successfully overcome this difficulty, and am informed by those who, having been quite unable to ride across country, immediately on adopting my contrivance have ridden as securely as before the injury occurred. The support is light, and worn without inconvenience, and is immovable when in use. Medical Men and Instrument Makers have heretofore entirely failed in treating this injury, it having been difficult to obtain a pressure to impinge on the right part, and, if obtained, equally difficult to retain in position.

Measures required—Circumference of Pelvis, top of Thigh, and state for which leg.

**EDWARD HUXLEY, 13, Old Cavendish Street, Oxford Street, W.**

Post-office Orders payable at Vere-street. Professional discount 20 per cent. where not marked "net." Medical Men, being charged the lowest price, are requested to send their orders direct, as there is no margin left as a profit for Agents.

Cheques crossed London and County Bank.

# HIGH-CLASS PHARMACEUTICAL PREPARATIONS.

## SAVARESSÉ'S CAPSULES.

What is the best way to give Sandal Wood Oil or Copaiba? They should be *pure*, and act near the disease without nausea or stomach disturbance. SAVARESSÉ'S Capsules of organic membrane answer these requirements; they do not dissolve in the stomach, but generally in intestines. Mr. W. ACTON, F.R.C.S. (p. 98, "Urinary Diseases"), recommended them. They

are increasing in favour with Medical Men who want *sure* results. Sandal Wood Oil, 4/6; Copaiba, 2/6 boxes.

## EVANS' FLUID EXTRACTS.

The Perfection of Pharmacy. Made with special menstrua, they represent weight for weight of the crude drug, of which they contain the *whole* of the active medicinal properties. Always reliable; keep well. Tinctures and infusions can be immediately prepared from them, one minim representing one grain of the drug.

*Full List, with Doses &c., on application.*

## SAVAR'S COCA WINE.

WHAT COCA WINE SHALL WE ORDER?

SAVAR'S, brought out in 1875, is standardised to contain  $\frac{1}{4}$ -grain pure Cocaine in each fl. oz., and 2 fl. drachms are a dose. Many Coca Wines cannot be sold by Chemists without a wine licence, because so weak in Cocaine—SAVAR'S can. Physicians know exactly what they are doing in ordering this stimulating tonic.

Bottles 4/- and 7/-  
(3/6 and 6/- for dispensing.)

*Lescher's Recent Materia Medica, 4th Edition, 500 Drugs, &c., with Doses, Formulæ, &c., 2/6.*

ALL ABOVE MAY BE PROCURED THROUGH USUAL TRADE CHANNELS.

EVANS, LESCHER, & WEBB,  
50, Bartholomew Close, London. Paris & Sydney Agencies.

## MONTSERRAT LIME-FRUIT JUICE.

True Lime-Fruit Juice is a very useful acid Drink, when diluted. The best is from the Consignee's Estate in Montserrat, W.I., of which over 100,000 gallons annually come over to the Sole Consignees. It is pure, reliable, pleasant, and a genuine anti-scorbutic.

In Imperial Pints and Quarts.

## Prescribe CASCARA-HAWLEY for Constipation.

A reliable Laxative is often wanted (especially for Ladies and Children), tasteless, and that can be swallowed with ease. Nothing can be better than the B.P. fl. Extract of Cascara Sagrada, rendered tasteless by an envelope or gelatine. Each Capsule is equal to  $\frac{1}{2}$ -drachm of fl. Extract. In Pregnancy and Habitual Constipation invaluable.

Box 20, 1/1½; 100, 4/6 per box.

## SAVAR'S CUBEB CIGARETTES.

Is there any real palliative for Asthma and Chronic Cough? Cubebs smoked so as to get the effect of the resins down the Throat is always worth a trial. Here we have the effect aided by Stramonium and softened by Cannabis Indica. To be smoked through the Nose for Hay Fever.

Boxes 1/- and 2/6.

EVANS, SONS, & CO., Liverpool.  
EVANS & SONS, Limited, Montreal.

# PARTURITION.

**ALETRIS CORDIAL (Rio)**, given in Teaspoonful doses every hour or two AFTER PARTURITION, is the best agent to prevent after-pains and hæmorrhage. By its DIRECT tonic action on the uterus it expels blood-clots, closes the uterine sinuses, causes the womb to contract, and prevents subinvolution. In severe cases it can be combined with ergot in the proportion of one ounce of Fluid Ext. Ergot to three ounces of Aletris Cordial. It is the experience of eminent practitioners, in all cases where ergot is indicated, that its action is rendered much more efficacious by combining it with Aletris Cordial in the proportions above stated.

## RIO CHEMICAL CO., ST. LOUIS, U.S.A.

*The above Preparation is prepared exclusively for the prescriptions of Medical Men. A Sample will be sent free to any Medical Man who desires to test it, on application to*

**BURGOYNE, BURBIDGES & CO., 16, Coleman Street, London.**

GENERAL DEPOT FOR GREAT BRITAIN.

## BULLOCK'S PEPSINA PORCI.

DOSE—2 to 4 grains.

## BULLOCK'S ACID GLYCERINE $\frac{1}{6}$ PEPSINE.

DOSE—1 to 2 drms.

In this preparation advantage has been taken of the solubility of Pepsine in Glycerine to produce a convenient and desirable *liquid form* of this valuable medicine; whilst the preservative qualities of the menstruum confer upon the Acid Glycerine of Pepsine the property of keeping for any length of time.

May be prescribed with most substances compatible with Acids. In 4-oz., 8-oz., and 16-oz. Bottles, and in Bulk.

The published experiments of G. F. DOWDESWELL, Esq., M.A. Cantab., F.C.S., F.L.S., &c., Dr. PAVY, Professor TUSON, the late Professor GARROD, Dr. ARNOLD LEES, and others, conclusively demonstrate the excellence, high digestive power, and medicinal value of the above preparations.

*In prescribing either of the above preparations, it is suggested to insert in parenthesis as follows (BULLOCK).*

**J. L. BULLOCK & CO., 3, Hanover St., Hanover Sq., London, W.**

# SYR. HYPOPHOS. CO., FELLOWS.

**CONTAINS THE ESSENTIAL ELEMENTS** of the Animal Organisation—Potash and Lime;

**THE OXIDISING AGENTS**—Iron and Manganese;

**THE TONICS**—Quinine and Strychnine;

**AND THE VITALISING CONSTITUENT**—Phosphorus : the whole combined in the form of a Syrup, with a **SLIGHTLY ALKALINE REACTION.**

**IT DIFFERS IN ITS EFFECTS FROM ALL ANALOGOUS PREPARATIONS;** and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

**IT HAS GAINED A WIDE REPUTATION,** particularly in the treatment of Pulmonary Tuberculosis Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

**ITS CURATIVE POWER** is largely attributable to its Stimulant, Tonic, and Nutritive Properties, by means of which the energy of the system is recruited.

**ITS ACTION IS PROMPT;** it stimulates the appetite and the digestion; it promotes assimilation; and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

## NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, **FINDS THAT NO TWO OF THEM ARE IDENTICAL,** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, **IN THE PROPERTY OF RETAINING THE STRYCHNINE IN SOLUTION,** and in the medicinal effects.

**As** these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. FELLOWS."

**As** a further precaution, it is advisable that the Syrup should be ordered in the original bottles (4s. or 7s.); the distinguishing marks which the bottles (and the wrappers surrounding them) bear can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

# "TRITICUMINA" BREAD.

(REG.)

The features of this process are: That (after treatment) the whole of the grain of wheat is ground for Bread-making, and a Bread obtained therefrom which does not cause the excessive irritation of the alimentary canal which is produced by the whole-meal bread of other processes, with the important additional advantage that the greater portion of the starch of the grain is converted into dextrine. The Bread produced has a fine, rich, home-made flavour, with a thin, perfectly uniform, and easily masticated crust.

### EXTRACT FROM THE LANCET ANALYSIS:—

"The specimen of bread made from this flour is an excellent brown loaf of uniform texture, having a sweet, nutty smell on fracture, and keeping moist and fresh several days. The microscope showed the presence of branny particles, but so small in size as to be hardly distinguishable by the unaided eye. We have not examined a better specimen of bread, or one that approaches more closely to the ideal."

Vide THE LANCET, page 420, 30th August, 1892.

Each Loaf has the word

"TRITICUMINA"

stamped on it.

2d. & 4d. per Loaf

CORRESPONDENCE INVITED from DOCTORS.

# "TRITICUMINA" FOOD.

TRADE MARK (Regd.) on each Tin of Food.

6d. & 1s. per Tin, of all Chemists.

See reports by the eminent Analysts, OTTO HEINER, London; ALFRED GORDON SALAMON, London; A. BOSTOCK HILL, Birmingham, &c., in Pamphlet.

"TRITICUMINA" is a Malt Food. Its great value, which distinguishes it from all other foods, lies in the fact that, instead of employing the barley malt of the market, the wheat is malted, under specially ascertained conditions, with the express purpose of rendering the product most suitable for use as a digestible food. It is rich in mineral matter, fine

BAKERS APPOINTED IN ALL DISTRICTS.

*New, Improved, and Perfected*

# PEPSALIA.

MEMBERS OF THE MEDICAL PROFESSION

Are invited to try the New, Improved, and Perfected **PEPSALIA**.

As we do not use in the manufacture of **PEPSALIA** any of those American Pepsines which are made from stomachs of pigs *fed on corn*, as such Pepsines do, not seem to have the same properties as those made from the stomachs of pigs fed on nitrogenous matter, the **PEPSALIA** we now make is perfectly white and odourless and its digestive power is increased.

**PEPSALIA** is guaranteed to remain good in any and every climate.

One saltspoonful of **PEPSALIA** is sufficient to digest an ordinary plate of food.

In bottles at 1s., 2s., and 5s. Special terms to Medical Men.

# PUMILINE.

WE respectfully beg to remind Members of the Medical Profession that there are few if any preparations which prove so beneficial in cases of Bronchitis and affections of the Throat and Chest as **PUMILINE**.

**PUMILINE ESSENCE** used either as an inhalation or administered internally (dose 2 to 5 minims) gives immediate relief and strengthens the mucous membranes.

**PUMILINE JUJUBES** contain a minim of the Essence, and are readily taken by adults as well as children.

**PUMILINE LINIMENT** is highly recommended as an embrocation for external use.

Medical Men who have prescribed **PUMILINE** during the last four years invariably express their satisfaction.

Pumiline Essence in bottles at 1s. 6d. and 2s. 6d.

Pumiline Jujubes in boxes, 1s. 1d. and 2s. 3d.

Pumiline Liniment in bottles at 1s. 9d.

**PUMILINE POROUS PLASTERS** are highly spoken of in cases where such treatment is indicated.

*When Prescribing PUMILINE please always write*

HUMPHREYS' COMPLETE HOSPITAL

Awarded the Certificate of the Sanitary Institute of Great Britain.

PERFECT VENTILATION, SUITED TO ALL CLIMATES, DURABILITY, RAPID ERECTION, VARNISHED WOOD INTERIOR, CLEANSING, & DISINFECTION

SECTION

PERSPECTIVE VIEW

## HUMPHREYS' WOOD AND IRON ISOLATION HOSPITALS.

EACH BUILDING IS WOOD AND FELT LINED, STAINED AND VARNISHED.

*Erected complete in 7 to 10 days.*

Amongst many others we have erected Hospitals at Abingdon, Ashby-de-la-Zouch, Bedford, Bideford, Bournemouth, Brighton, Canterbury, Cardiff, Chesterfield, Edinburgh, Ilkley, Leeds, Lofthouse, Lowestoft, Mansfield, Melton Mowbray, Otley, Pembroke Dock, Queensferry, Rushden, Southampton, Stratford-on-Avon, Taunton, Totton, Uppingham, Waterford, Worcester, Wigan, and Willesden; and are now constructing at Chesterfield, Edinburgh, South Shields, Scarborough, also Metropolitan Asylums Board, Tottenham.

Qualities and advantages claimed for Humphreys' Hospitals:—Durability, Stability, Simplicity, Facility of Erection and Removal, Cleansing and Disinfection, and fitted for all climates. Experience in the construction of over 5000 Iron Buildings in all parts of the world for the Government, Corporations, Local and other Authorities.

ISOLATION HOSPITALS are in STOCK at the GROUNDS and WORKS, KNIGHTSBRIDGE, HYDE PARK, LONDON, S.W.

WORKS OPEN FOR INSPECTION, 8 a.m. to 6 p.m.

Telegraphic address—"HUMPHREYS, KNIGHTSBRIDGE, LONDON."

# THE ORIGINAL RAW FOOD EXTRACT.

(Prescribed by the Medical Profession since 1878.)

AN IDEAL FOOD.		<b>BOVININE</b> • A RAW FOOD EXTRACT.	IT STANDS ALONE.
----------------------	---	--	------------------------

THE VITAL PRINCIPLES OF BEEF CONCENTRATED.

**CONTAINING 20 PER CENT. OF COAGULABLE ALBUMEN.**

Its ready assimilability, its marked nutritive quality, its stimulating power and restorative force, make **BOVININE** a most valuable aid in all treatment where a true nutrient is indicated.

**INTRODUCED STRICTLY TO THE PROFESSION.**

**BOVININE** owes its present high position in the medical world to the fact that its introduction has been confined strictly to the Profession.

Thousands who have given it a careful trial during the past fifteen years, in all parts of the world, freely testify to its unrivalled worth.

As *personal experience alone convinces*, we invite all who are not acquainted with its great nutrient value to put **BOVININE** to the most *critical* tests and *watch the results* obtained from its use.

**SAMPLES FREE, CARRIAGE PAID.**

PREPARED ONLY BY

**THE BOVININE COMPANY,**

CHICAGO and NEW YORK, U.S.A.

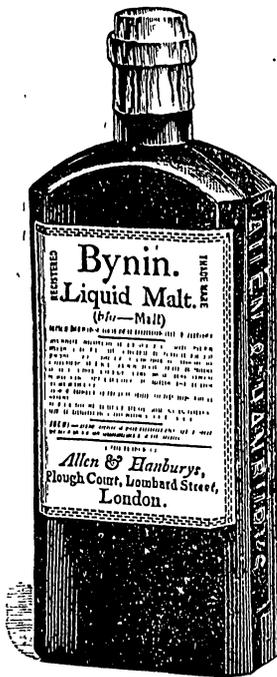

DEPOT FOR THE UNITED KINGDOM—32, SNOW HILL, LONDON, E.C.

SOLD BY CHEMISTS.

IN BOTTLES, TWO SIZES, 12 oz., 4s. 6d.; 6 oz., 2s. 9d.

# BYNIN AND ITS USES.

SO many are the advantages of this *liquid preparation of Malt* over the thick Extract, and so varied are the methods of using it, suggested by the experience of ten or more years of increasing popularity with the profession, that it is difficult to give at all a complete account within the limits of a comparatively small space. In what follows an attempt is made to briefly indicate the more important lines on which the use of Bynin is being conducted:—

*Firstly.*—As an *Aid to Digestion* and as a *Nutritive agent*, Bynin is of the first importance, containing, as it does, Diastase in its most active form, with its powers unimpaired by heat, and also *Carbohydrates, Proteids, and Phosphates*, all of which are of great value as foods.

*Secondly.*—As a *Nutritive Beverage* Bynin may be mixed with aerated waters and used in place of Beer, Stout &c., thus avoiding all danger of creating or fostering an alcoholic habit.

*Thirdly.*—Mixed with *Milk*, Bynin has special properties as an adjuvant to its complete digestion, and prevents the aggregation of the casein in large clots usually seen on the addition of acids. Thus those who after taking a draught of milk feel a sense of discomfort over the stomach can, by the previous addition of Bynin, take it freely, and ensure its speedy digestion. *This is a great boon to nursing mothers.* If taken in the place of stout or porter, it has the best results, the flow of milk being increased, and its quality much enriched; whilst at the same time it is rendered more easy of digestion for the child.

*Fourthly.*—With *Porridge* and other *Farinaceous Foods*, Bynin, when well mixed, at once starts a process of digestion, so that before the food can be taken into the mouth a large part has already been made assimilable.

*Fifthly.*—As a *vehicle* for bitter or sour medicines, or chemical foods, Bynin has been found very useful, rendering reasonably palatable an otherwise nauseous or unpleasant draught.

*Byno-Lypophosphites* and *Byno-Phosphates* are familiar preparations, in which the sugar of the ordinary syrups is *entirely* replaced by the valuable nutritive and digestive constituents of malt. *These latter are sold at 2s. 6d. and 4s. 6d.; 2/4s. and 4/1s. per dozen to the Profession.*

**METHOD OF ADMINISTRATION.**—The *best* way to take Bynin is *during the meal*. It may be sipped slowly either by itself, or mixed with water, wine, milk, soda water, lemonade &c., or may be taken stirred up with Gruel or farinaceous puddings. It is better taken in this way than after the meal, when its action is much hampered by the acid secretion of the stomach. Nursing mothers should take one tablespoonful, in half a tumbler of new milk, three times a day *between meals*.

One FLUID ounce of Bynin represents one ounce by WEIGHT of Allen & Hanburys' ordinary thick MALT EXTRACT, which is sold in wide-mouthed jars, similar to their Bynol jars, at (retail) 1s. 6d. and 2s. 9d. each; 12s. and 21s. per doz. to the Profession.

THE LANCET writes: "We find that one ounce of Bynin will digest perfectly one pound of starch. This is a most favourable result, and, coupled with the fluidity and pleasant flavour, renders this preparation a most valuable one."

*In Bottles at (retail) 1s. 9d. and 3s. each; 16s. and 27s. per dozen to the Profession.*

## BYNO-PEPSIN.

*Byno-Pepsin* is a solution of Pepsin in Bynin, and since both are in a peculiarly active form, valuable aid is thus afforded to the digestion both of Proteids and Starchy foods: this preparation is especially useful in dyspepsia dependent on deficient secretions.

*In Bottles at (retail) 2s. 6d., 4s. 6d. and 8s. 6d. each; 23s., 41s. and 72s. per dozen to the Profession.*

# BENGER'S PREPARATIONS

OF THE

# NATURAL DIGESTIVE FERMENTS

AND

## SPECIAL FOODS FOR INFANTS AND INVALIDS.

### 1. LIQUOR PANCREATICUS (BENGER).

For the preparation of peptonised or partially digested foods, such as milk, soups, beef-tea, &c. *In 4-oz., 8-oz., and 16-oz. Bottles, with simple directions for use.*

THE LANCET says:—

"So many worthless articles of this kind have been sold that great care is required in choosing those upon which reliance can be placed. Mr. Benger's care has therefore been well spent."

### 2. BENGER'S PEPTONISING POWDERS.

These Powders may be used instead of LIQUOR PANCREATICUS (BENGER) to peptonise milk &c. They are colourless, odourless, and instantly soluble.

One powder will rapidly peptonise a pint of milk, gruel, soup, &c.

*In Boxes of 12 Powders, retail 2s. 6d.*

### 3. LIQUOR PEPTICUS (BENGER).—A Concentrated and exceedingly active Fluid Pepsine.

It is prescribed in doses of one or two teaspoonfuls in a wineglass of water, wine, or weak spirit-and-water, with meals. It is without disagreeable taste.

*In 4-oz., 8-oz. and 16-oz. Bottles.*

### 4. BENGER'S PEPTONISED BEEF JELLY.—A Delicately Flavoured, Concentrated, Partially Digested, and Solidified Beef-tea.

*In Glass Jars, retail price 2s. each.*

It can be taken by teaspoonfuls, cold, as a jelly, or, dissolved in a little hot water, as a concentrated beef-tea. It is also used to fortify or enrich ordinary beef-tea, soups, &c. It affords to invalids, when travelling, a ready and convenient form of concentrated nutriment.

### 5. BENGER'S PEPTONISED CHICKEN JELLY.—A Nutritive Delicacy for Invalids.

*In Glass Jars, 2s. each.*

It is prepared in a similar manner to the PEPTONISED BEEF JELLY above described, and, like it, contains the nutritive constituents in a concentrated, partially digested, and solidified form.

### 6. BENGER'S FOOD (Pancreatized), Registered.—For Infants, Children, and Invalids.

*In Tins, 1s. 6d., 2s. 6d., 5s. and 10s., with directions for use.*

A great improvement on the various forms of Liebig's Food. When mixed with warm milk the pancreatic ferments render the farinaceous matter soluble and reduce the casein to the same digestible condition in which it exists in human milk, so that hard masses of curd cannot be formed in the stomach. Experience has shown that delicate children and adults with weak digestions can enjoy and retain this food when all others disagree.

### 7. BENGER'S NEW ESSENCE OF RENNET (Curdling Fluid).

For preparing fresh Whey, Junkets, &c.

*Bottles, 1s. and 1s. 9d. Directions for use enclosed.*

### 8. PEPTONE SUPPOSITORIES (BENGER).—For Rectal Alimentation.

*In Boxes of 6 and 12*

### OPINIONS OF THE MEDICAL PRESS.

#### THE LANCET.

"We have on a previous occasion noticed some of Mr. BENGER'S admirable preparations. Those now before us are not less satisfactory."

#### The BRITISH MEDICAL JOURNAL.

"Time and use have justified the claims put forward for these preparations."

#### The PRACTITIONER.

"All these preparations are, we think, deserving of the highest praise, and only require to be made known to the profession to ensure their extensive employment."

#### The LONDON MEDICAL RECORD.

"These are undoubtedly a great advance on any previous attempt in this direction. The introduction of these preparations is a distinct advance in Therapeutics."

#### The MEDICAL TIMES AND GAZETTE.

"BENGER'S preparations have deservedly a very high reputation, and are all largely used."

BENGER'S PREPARATIONS may be obtained through all Wholesale and Retail Houses, or direct from the Manufacturers.

# PEPTONIZED MILK

(PATENT CONCENTRATED).

The remarkable value of Peptonized (*predigested*) Milk has now been completely established. Without calling for any digestive effort, it can, in the absence of all other food, supply the system for an indefinite period with the nutriment which it requires. The great drawback to the more extended use of Peptonized Milk has been the trouble, care, and even skill required to be daily expended to prepare a fairly palatable and uniformly peptonized product. These disadvantages are entirely obviated by the use of this Concentrated Preparation, as by mere dilution with water a deliciously-sweetened Peptonized Milk, of uniform composition, can be instantly prepared by the most inexperienced person.

*Tins, 1s. 6d. and 2s. 6d.*

# PEPTONIZED COCOA AND MILK

(PATENT CONCENTRATED).

In this preparation the Cocoa as well as the Milk is peptonized and rendered soluble, and is therefore more readily assimilable than any other preparation of Cocoa extant, and can be digested by even the most confirmed dyspeptic. Besides its extreme digestibility, its perfect palatableness renders it a most delicious as well as wholesome beverage, which can be taken alike by the invalid and by those who, although otherwise healthy and robust, frequently experience a difficulty in digesting any form of Cocoa. For general convenience in use it is unrivalled, as no addition of milk or sugar is needed, but only mixture with hot water.

*Tins, 2s. 6d., to make fifteen breakfast cups of Cocoa, or ten or more breakfast cups of rich Chocolate. Also in Smaller Tins, 1s. 6d. each.*

N.B.—The milk used in these preparations is secured from farms under our control, and where the sanitary arrangements have been made perfect, and in addition to this, sterilisation after the most approved modern methods is provided for, thus ensuring complete immunity from communication of the infectious diseases which are unhappily so often spread by means of milk.

## OPINIONS OF THE MEDICAL PRESS.

THE LANCET, June 15th, 1889:—

“Peptonized Milk (Patent Concentrated) is an excellent article. In consistence it is like a thick cream, agreeable in flavour, and yet so well peptonized that it gives no coagulation with dilute hydrochloric acid, even after heating. It will be of great value. The Peptonized Cocoa and Milk (Patent Concentrated) is clearly founded on the above. In appearance it resembles chocolate cream, and it is delicate in flavour, and yet peptonised. It is almost needless to say of Messrs. Savory & Moore’s novelties that they are well prepared.”

The PRACTITIONER, July, 1889:—

“We have carefully examined and tested Savory & Moore’s Peptonized Cocoa and Milk and Peptonized Milk, and have used them ourselves and for patients of fastidious appetite. We find them well peptonized, capable of keeping even when the tins are opened for a considerable time, and very palatable. The Cocoa and Milk forms a thin and inviting beverage of a pleasant nutty flavour, and is retained well even in cases of chronic neurotic vomiting. The peptonised Milk mixes well with tea or coffee, and improves the taste of both. These properties render Messrs. Savory & Moore’s latest preparations a valuable addition to the sick-room dietary, and we can recommend them to the profession.”

The MEDICAL PRESS AND CIRCULAR, Sept. 4th, 1889:—

“The Peptonized Cocoa and Milk and Peptonised Milk introduced to our notice by Messrs. Savory & Moore, like everything emanating from their laboratory, are most carefully prepared and of the highest quality. There is, moreover, a delicacy in flavour and aroma with the Peptonized Cocoa which shows at once that the products of selected growths only obtain a place here. It is, therefore, one we can unhesitatingly recommend.”

N.B.—THESE PREPARATIONS KEEP WELL AFTER THE TINS ARE OPENED.

## SAVORY & MOORE,

*Chemists to the Queen, H.R.H. the Prince of Wales, H.H. the Khedive of Egypt, &c.,*

143, NEW BOND STREET, LONDON.

# SAVORY & MOORE'S BEST FOOD FOR INFANTS.

*The attention of the Medical Profession is especially requested to the following characteristics of this old-established **SELF-DIGESTING Food**, which has so thoroughly maintained its reputation for superiority during an experience of 30 years:—*

Ratio of Albuminoids to carbohydrates.

Albuminoids easy of digestion, not pre-digested.

Healthy nature of evacuations.

The curdling of Cow's milk prevented.

Complete conversion of the starch.

Retention of the Phosphates and Fat.

Absence of fermentable sugar.

Verdict of Jury as to inferiority of imitations.

The ratio of the albuminoids to the carbohydrates is the same as in human milk—viz., 1 to 6·4; the ratio in cow's milk being only 1 to 3·8.

The albuminoids are not predigested as in pancreatised foods, but are rendered easy of digestion, leaving (as in human milk) just sufficient work to strengthen and develop the immature digestive powers, instead of weakening and abrogating them by keeping them inactive. Sir WILLIAM ROBERTS'S experiments in feeding kittens show that distinct failure of nutrition occurs when the milk is predigested (peptonised), and the same thing has been observed in feeding infants, probably owing, as THE LANCET points out, to atrophy of unemployed glands.

As a consequence of the foregoing the proper peristaltic action of the bowels is maintained, and the healthy nature of the evacuations of infants fed on this food is a satisfactory feature much and favourably commented on by Mothers and Nurses.

When mixed with cow's milk it prevents the troublesome curdling in the stomach which takes place when cow's milk is given alone, and assimilates its composition to that of human milk.

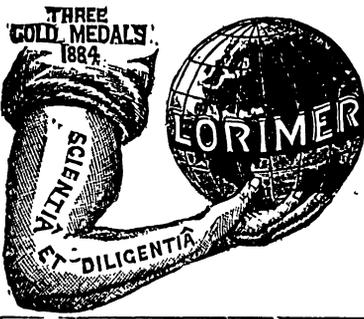

The active Malt Diastase present provides for the rapid and complete conversion of the starch at the time of mixing into the soluble assimilable products of maltose and dextrine. The point of the gelatinisation (thickening) of the Food—viz., 140° F.—is just that at which Malt Diastase is most active, and the conversion of the starch is consequently the work of a very few minutes only.

The retention of the fat and of the phosphates of the wheat and malt, which are so essential to bone formation. These exist chiefly in the outer portions of the grain, the very parts which some manufacturers pride themselves upon so successfully rejecting.

The absence of the fermentable sugar, which in the various malt extracts and milk foods so often gives rise to Diarrhoea and Flatulence.

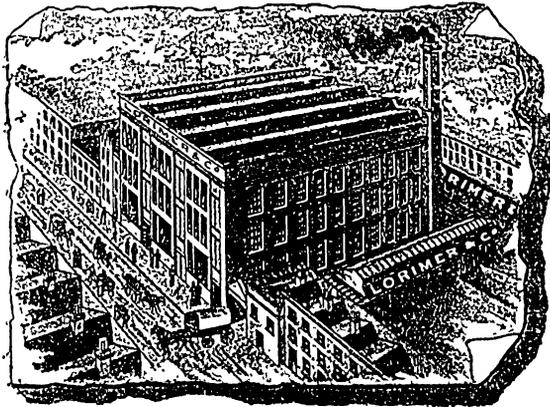

It is the *only* Infants' Malted Food which obtained a Gold Medal at the International Health Exhibition, the Jury being comprised of such authorities as Dr. ATTFIELD, F.R.S.; G. W. WIGNER, F.I.C., the then President of the Society of Public Analysts; Dr. JAMES BELL, F.R.S., the Head of the Government Laboratories; and other distinguished Medical and English and Foreign Experts. This affords significant indication of the value to be attached to the numerous imitations, which, whilst pirating the descriptive notices of the Food, utterly fail to approach its standard of excellence.

**SAVORY & MOORE,**  
143, NEW BOND STREET. LONDON, W.

# LORIMER'S RELIABLE PREPARATIONS AND SPECIALITIES

FOR THE MEDICAL PROFESSION.

## BEEF AND MALT WINE (LORIMER'S).

A most invigorating form of liquid nourishment, very palatable to take. It is prepared with a fine sound Port, Liebig's Extract of Beef, and Extract of Malt (Lorimer's), and its high character and purity are strictly maintained and guaranteed.

In pint Champagne Bottles, 20s. per doz.  
In quart " " 33s. per doz.

## PURIFIED TEREBENE (LORIMER'S).

For the relief of Winter Cough, Chronic Bronchitis, Phthisis &c.

"Pure Terebene is a powerful expectorant, and if inhaled the first thing in the morning, when the mucous membranes are covered with thick viscid secretion, will give very great relief. It is of such value in winter cough that I rarely experience the necessity of resorting to other remedies."—Dr. MURRELL in BRITISH MEDICAL JOURNAL.

In 4-oz. and 8-oz. Bottles, 1s. and 2s. each.

Pure Terebene (Lorimer's), in 10 mm. Capsules. Boxes containing thirty-six, 8s. 6d. per dozen boxes.

## COD LIVER OIL (LORIMER'S).

Finest quality selected oil, absolutely pure, and almost devoid of taste or smell.

Extract from Letter of an Eminent Firm of Pharmaceutical Chemists.

Messrs. LORIMER & Co.

Brighton, April 18th, 1884.

"Gentlemen—The New Cod Liver Oil smells like new milk ..... VERY NICE ..... We have tried it alongside other samples, none of which have this characteristic sweetness."

"There is no finer oil procurable."

In 8-oz. Bottles, 7s. 6d. per dozen. In 16-oz. Bottles, 13s. per dozen.

## COD LIVER OIL WITH MALT EXTRACT (LORIMER'S).

A perfect combination of our Extract of Malt and Cod Liver Oil, the malt assisting the most delicate stomach to retain the oil, and aiding its assimilation; a desideratum long sought by the profession—viz., an elegant preparation at a moderate price.

In 1-lb. Bottles, 2s. each.

LORIMER & CO., BRITANNIA ROW, ISLINGTON, LONDON, N.

## WHY MEDICAL MEN PREFER

WITH

## COD-LIVER OIL

## TO OTHER PREPARATIONS OF COD-LIVER OIL &amp; MALT.

Because of:—

- (a) Its Keeping Properties. The Oil is so perfectly associated with the Maltine that it will keep for any length of time and never separates. This cannot be said of any other preparation of oil and malt.
- (b) Its Freedom from all  
Odour of  
Cod-liver Oil. Maltine is a delicious, appetising, digested Food, possessing, as Prof. Attfield says, "the flavour and odour of a delicate sweetmeat." In the above combination it effectually masks the taste and smell of the oil, so that it will readily be taken by those who reject other forms of cod-liver oil and malt.
- (c) The Economy of its Use. The whole of the oil is absorbed into the system; it is thus the most economical mode of prescribing cod-liver oil.
- (d) Its Superior  
Reconstructive  
Constituents. The bone and muscle producing elements of wheat and oats, the digestive properties of malted barley, and the fat-forming powers of cod-liver oil, render this combination a food of incalculable value in Consumption, Wasting Diseases, and General Debility.

The BRITISH MEDICAL JOURNAL, referring to our preparation (March 24th, 1888), reports:—"It has long been known that some patients who are unable to tolerate the purest and most carefully prepared cod-liver oil can readily digest and assimilate it when mixed or combined with Maltine. .... The admixture is complete and permanent, and the consistence is very convenient. .... As regards taste, that of the cod-liver oil is almost entirely concealed, and what suspicion there is of it is not at all unpleasant. ... We can recommend it on the ground of *its perfect admixture, the ease with which it is assimilated, the good quality of the Cod-liver Oil, and the value in diastase of the Maltine.*"

The MEDICAL PRESS AND CIRCULAR (March 28th, 1888) reports:—"The oil is intimately blended with the malt, and fulfils all the conditions of perfect digestion. Maltine is an excellent medium for the oil, besides aiding materially in its digestion. It has the additional merit of converting it into an elegant and palatable preparation."

SAMPLES FREE TO MEDICAL MEN.

The word "MALTINE" is our Registered Trade Mark.

THE MALTINE MANUFACTURING COMPANY, Limited,  
24 and 25, HART STREET, BLOOMSBURY, LONDON, W.C.

**THE LANCET:—**

"We are bound to admit the great excellence and elegance of this new method. The Profession generally will not be slow to recognise its very obvious advantages. Will, as a matter of course, meet with hearty and very general approval. Their employment places the administration of exceedingly unstable compounds like ferrous carbonate, phosphate, and arseniate upon a sounder and more scientific basis."

**BRITISH MEDICAL JOURNAL:—**

"The 'Bi-palatinoid' is an excellent method for the administration of ferrous carbonate in a pure unoxidised state. The air-tight covering entirely protects the contents from atmospheric influences and the shape renders deglutition easy. We regard these 'Bi-palatinoids' as a very ingenious and marked progress in elegant and efficient pharmacy."

**MEDICAL ANNUAL:—**

"One of the most elegant and efficient methods of administering medicines with which we are acquainted. Well worthy of the attention and the gratitude of the Profession."

**HOSPITAL GAZETTE:—**

"Among recent improvements in pharmacy there is none more ingenious, meritorious or practically useful than 'Palatinoids.' The merits of this method of administering certain medicines are such as will, we feel sure, ensure its adoption."

**INDIAN MEDICAL RECORD:—**

"Assuredly the climax of pharmaceutical perfection at the present day. For use in India we wish to lay stress on the fact that the samples we have tried]throughout the present monsoon weather, with its attendant dampness and heat, have stood the test admirably and those that remain seem to be as fresh and perfect now as when we got them."

# SENSIBLE NEW YEAR PRESENTS.

The "A B C" MEDICAL DIARY  
and VISITING LIST for 1893.

THOSE who desire to make New Year Presents with the certainty of their being well appreciated will find on this page a selection of goods especially suitable for, and interesting to, Medical Men.

The Diary for the coming year is now ready. It is of the same convenient size as heretofore, and contains sufficient space to record 56 or 112 visits weekly, as may be desired; pages for Cash Accounts, Obstetric and Vaccination Memoranda, engagements under the Factory Act &c. &c.

But the most important feature of the present issue is "THE EXCERPTA THERAPEUTICA," a synopsis of the latest information in Therapeutics, carefully selected from the latest editions of native and foreign works on this subject, the authorities or source in each case being given. We venture to hope that the completeness and compactness and general usefulness of our Diary will render it more acceptable and more popular than ever.

The Medical Press, speaking with reference to the 1892 edition, was unanimous regarding its distinct advantages.

THE LANCET reports, "A book which cannot fail to be of use to medical men engaged in general practice."

THE BRITISH MEDICAL JOURNAL said, "It is compact and contains a good deal of useful information."

THE LONDON MEDICAL RECORDER remarks, "It does not exceed the orthodox size and bulk."

THE EDINBURGH MEDICAL JOURNAL says, "The book is elegantly got up, and contains much valuable information."

With Silk Binding, 2/6 each; with Leather Tuck Covers, 2/6 each. WALLETS ONLY—Morocco, 2/- each; Velvet Pile, 3/- each; Russia Leather, 3/- each. DIARIES and WALLETS TOGETHER—Morocco, 4/-; Velvet Pile, 5/-; Russia Leather, 5/-.

## PERPETUAL DIARY.

We also issue a Perpetual Medical Diary, which is arranged so as to be conveniently used for any date or year.

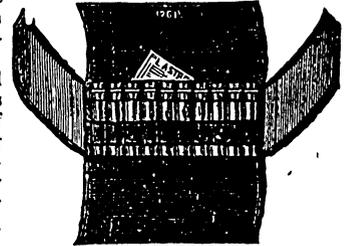

Silk Covers, 4/- each; Leather Tuck Covers, 4/- each.

Price List of above and others of our Special Products to be had on application.

B., W. & CO. MEDICINE CASES.

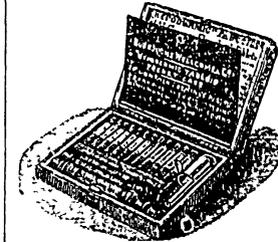

Fitted with a most useful assortment of Compressed Drugs in the form of "Tabloids" suitable for New Year Presents.

The "Tabloid" form of Compressed Drugs has fairly revolutionised the system of filling Medicine Chests and Cases, and is particularly well adapted to the requirements of Cases intended for the Pocket or for a place in the carriage. The portability, completeness, practical character and usefulness of these cases are admittedly points of real value in estimating their suitability as presents. We shall be happy to send our list, giving particulars and prices, on request.

## B., W. & CO. HYPODERMIC "TABLOID" POCKET CASES.

The Perfection to which we have brought our "Tabloids" for Hypodermic use, their quick solubility and physiological activity, and the number of improvements we have been able to introduce into the instruments, combine to make one of these Cases the most acceptable gift to a Medical Man one could suggest.

These Cases are fitted with our Regulation Pattern Syringe or with the New Patent Pure Aluminium pattern, just brought

out, as the purchaser may choose. Equipped with one of these cases, the physician is prepared for a wider range of emergencies than he could possibly meet in any other way, and they have been adopted by the leading men throughout the world of Medicine and Surgery, Military, Naval, or Civilian. These Cases may be had fitted complete as follows:—

No. 7, fitted complete, and containing 12 Tubes assorted,	15/- each.
No. 9, " " " 6 " "	12/- " "
No. 13, " " " 12 " "	20/- " "
No. 21, " " " 9 " "	16/- " "
No. 26, " " " 4 " "	11/- " "
No. 30, " " " 15 " "	16/- " "

[The last-mentioned is our most recent design ("THE MINIATURE"), an exceedingly compact and practical little Case, and one we can heartily recommend as an ideal *multum in parvo* armamentarium.]

**HYPODERMIC "TABLOIDS"**  
(Compressed Drugs), prepared by BURROUGHS, WELLCOME & CO.

Put up in Tubes, each Tube containing from 12 to 20 "Tabloids."

THE LANCET reports: "They are readily soluble and not at all irritating. They present the advantages that the dose is always accurate, the principle unchangeable, and that they are compact and perfectly soluble."

KING OF TABLE WATERS.

CHARGED ENTIRELY WITH NATURAL GAS.

PREVENTS

**GOUT, RHEUMATISM, & INDIGESTION.**

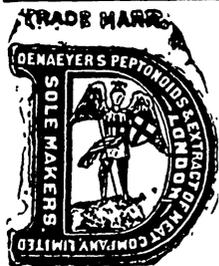

MIXES EQUALLY WELL WITH WINES, SPIRITS, OR MILK.

The finest tribute ever accorded to sterling merit is contained in THE LANCET of August 8th, 1891, pages 307-8, which embodies the “Report of THE LANCET Special Commission on Natural Mineral Waters,” “Johannis”—the subject of the Report—being selected from amongst the Natural Mineral Waters of the world as alone worthy of this unprecedented distinction.

SUPPLIED AT ALL FIRST-CLASS HOTELS, CLUBS, & RESTAURANTS.

Sample Cases of 50 Pints; 18s. 6d., bottles included.

THE “JOHANNIS” COMPANY, LIMITED,  
25, REGENT STREET, LONDON, S.W.

“The proteid stored in the animal tissues is from two sources: from that which has been absorbed unaltered, and from that formed by the regeneration of peptones.

“But what quantitative proportion do they bear to each other? How large is the portion of the proteid of the food which is peptonised in the alimentary canal?

“Schmid Mülheim tried to find an answer to this in the following way: He fed six dogs on boiled meat, killed them, one, two, four, six, nine, and twelve hours afterwards, and examined the contents of the stomach and intestines. In each case he found considerably more peptone than dissolved proteid, both in stomach and intestine. It thus appears that the greater part of the proteid became absorbed after peptonisation.”

TEXT-BOOK OF PHYSIOLOGICAL AND PATHOLOGICAL CHEMISTRY, 2nd Edition, 1890.  
Prof. BUNGE. (Translated by L. C. WOOLDRIDGE, M.D., B.Sc.)

**DENAAYER'S LIQUID STERILISED PEPTONE OF MEAT.** 1/- per Bottle.

Contains upwards of 20 per cent. of dry matter, of which THE LANCET says: “About one-third of the whole dry matter consists of TRUE PEPTONE, and another third of ALBUMOSE, a variety of albumen which is not coagulated by heat.”

**DENAAYER'S POWDER OF PEPTONE OF MEAT.** A soluble preparation of the Nutritive

Constituents of Beef in the form of Albumose Peptone, suitable for dissolving in the ordinary food of the patient, or for Rectal Alimentation.

**DENAAYER'S LIQUID PEPTONATE OF IRON.** 1/6 per Bottle. A chemical union of the metal with Albumose Peptone, in order to facilitate the physiological entry of iron into the circulation. Both pleasant and delicate.

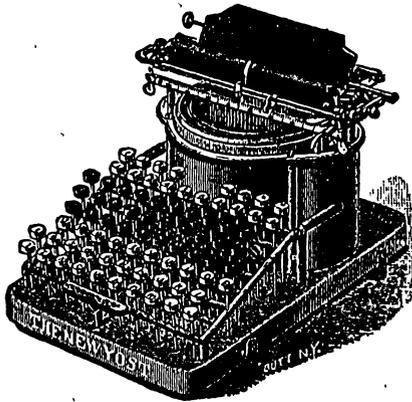

**PULVIS FERRI PEPTONATIS (Denaeyer).** 4/- per ounce. Soluble in water and compatible with other medicines.

**PEPSINA PORCI (Denaeyer).** 9/- per ounce in scale or powder. Soluble in water, free from odour and all unpleasantness. The most powerful peptogens yet available, obtained by a new and perfect process from the stomach of the pig.

# THE SUCCESS OF THE YOST TYPE-WRITER

during the first year's business of the Company has been unprecedented in the history of any similar undertaking.

It has just been awarded TWO GOLD MEDALS, the only Gold Awards to Typewriters at the Concours National, Paris, and South African Exhibition at Kimberley.

THE YOST IS USED IN THE LANCET OFFICE.

Such facts prove real merit; the YOST is indeed the simplest, the strongest, yet most portable, and the BEST TYPE-WRITER. Innumerable unsolicited testimonials confirm this; and the independent testimony of purchasers of instruments is to be preferred to the representations of parties interested in the sale of the various machines.

**MISREPRESENTATION FULLY EXPOSED.**

"THE BOVINE FOODS COMPANY,  
"POCOCK STREET, BLACKFRIARS, LONDON, S.E.,  
August 8th, 1892.

"DEAR SIRS,—On proposing to purchase a YOST Type-writer to replace an older make we were assured that repentance would swiftly follow the attempt to use this 'vexatious toy' for our work. To minimise the cost of our delusion one at half your price was generously offered us as the property of an unfortunate purchaser (said to be in the North) who had arrived on the pentient stool to which we were said to be rapidly hastening. As delivery of it here was indefinitely delayed, we have now to report that after hard daily usage for six months of the YOST you supplied us, it is doing excellent work. We are in every way satisfied that the change is a decided improvement.

"Yours faithfully,  
"THE BOVINE FOODS COMPANY.  
(Signed) "G. A. MOORE, Manager."

**QUICKLY LEARN'T AND EASILY HANDLED.**

The Rev. N. Curnock, Editor of the "Methodist Recorder," says:—  
"Type-writing for business and literary purposes will soon become as popular in England as in America. The saving in time, even for a writer who has not attained to expertness, is an item of great importance. Strange to say, the manipulation of keys, instead of hindering, assists the process of composition. The advantages of legible copy are obvious. Mistakes are prevented and time in reading and editing is saved. Both in America and in England we have seen and discussed the merits of several forms of type-writers. On the whole, the YOST appears to be the best. It is clean, clear, strong, quickly learnt and easily handled. In one day a young girl who had never before touched a type-writer produced excellent copy, and in a very few days had acquired fair speed."

**THE YOST HAS NO RIBBON.**

## HOCKIN, WILSON & CO'S BELFAST LINEN CATHETERS AND BOUGIES.

These Catheters and Bougies are made of strong Belfast Linen Thread, carefully woven and covered by a new method with extremely elastic gum. The process of manufacture occupies many weeks, and the goods are so thoroughly prepared that they are flexible and durable to an extent hitherto unknown. The advantage of combining strength, flexibility, and a smooth, polished surface in a catheter or bougie is apparent to anyone familiar to the article. The danger from using an instrument liable to crack or break at any time is very serious, but with the Belfast Linen Instruments this cause of danger is quite removed; the flexibility of the material is so marked that but little difficulty is ever experienced in use, and as they are made with cylindrical, olive, or mercier points their adaptability to all cases is, of course, considerably enhanced.

### A NEW CATHETER TIP (ANTISEPTIC, NON-BREAKABLE).

Heretofore in all Flexible Catheters, whether with woven or cut eyes, at least one quarter of the body of the tube is displaced where the eye occurs, and the Catheter is consequently made weakest at the very part where the most strength is required. This general defect has been overcome in the Metal Eye Belfast Linen Catheters, by attaching a properly constructed German Silver Eye Piece, which is firmly woven inside the tip of the Catheter, so that it not only thoroughly protects the weak part about the eye, but makes the head of the Catheter perfectly solid and antiseptic. In the Olive and Conical patterns additional stability is given to the slender points by means of a catgut inside, which extends from the metal eye to the extreme tip, and makes the points solid and firm.

## WRIGHT'S EAR SYRINGE (Patented).

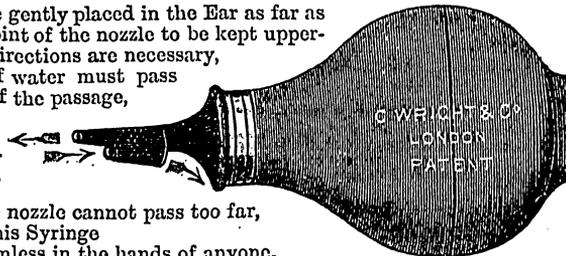

FOR THE USE OF PATIENTS AND NURSES.

RECOMMENDED BY THE LEADING AURAL SURGEONS.

The Syringe to be gently placed in the Ear as far as convenient. The point of the nozzle to be kept uppermost. No further directions are necessary, (as the stream of water must pass along the roof of the passage,

consequently the Ear is completely cleansed.

The point of the nozzle cannot pass too far, so this Syringe is perfectly harmless in the hands of anyone.

PRICE 5/6.

Vide THE LANCET, Dec. 24th, 1892:—

"A NEW EAR SYRINGE.

"Messrs. C. WRIGHT & Co. of New Bond-street have submitted to us an ear syringe for the use of patients and nurses. It is not always an easy matter to provide a syringe which will be used effectually by unskilled persons, and at the same time it is, in certain inflammatory diseases of the ear attended with profuse discharge, most necessary that the ear should be completely cleansed several times in the course of the day. This syringe ensures two requirements:—1st. The stream of water or other fluid passes along the roof of the canal and so the ear is thoroughly cleansed. 2nd. No injury can be done to the ear, as the nozzle is so constructed that it cannot be inserted too far. The ingenious arrangement which secures this also forms a passage for the returning stream of fluid."

Sole Manufacturers: C. WRIGHT & CO., SURGICAL INSTRUMENT MAKERS, 108, New Bond Street, London.

**TAMAR****INDIEN****GRILLON.**

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

**CONSTIPATION,**

**HÆMORRHOIDS, BILE,  
CEREBRAL CONGESTION, HEADACHE,  
LOSS OF APPETITE,  
INTESTINAL OBSTRUCTIONS, &c.,**

By augmenting the peristaltic movement of the intestine without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness; and the same dose always produces the same effect—that is to say, never needs increasing.

It is recommended by the most eminent physicians of Paris, notably Drs. BRUN and TARDIEU, who prescribe it constantly for the above complaints and with most marked success.

Wholesale—London: E. GRILLON, 69, Queen Street, Cheapside.  
Sold by all Chemists and Druggists, 2s. 6d. a Box, stamp included.

**EXALGINE. THE MOST EFFICIENT ANALGESIC.**

The analgesic properties of **EXALGINE** have been fully established by prolonged and searching trials throughout Europe and America.

**EXALGINE** relieves pain in Neuralgia of all kinds, Sciatica, Lumbago, Locomotor Ataxy, Chorea, Cephalalgia in the Influenza, &c. The following authorities have published their reports from time to time:—Prof. Frazer of Edinburgh and Dujardin-Beaumetz, Paris; Dr. Bardet, Paris; Dr. Gaudineau, Paris; Dr. Desnos, Paris; Drs. Gougenheim and Désiré, Paris; Dr. Combevalle, Lille; Dr. Heinz, Berlin; Dr. Rabow, Berlin; Dr. Löwenthal, Berlin; Dr. Gubb, London; Dr. Herschell, London; and, lately, Dr. John Gordon of Aberdeen University and Dr. T. Churton of Leeds (THE LANCET, May 28th, 1892).

DOSE: 1 to 6 grains in Alcoholic Solution or Cachets, also hypodermatically. (See *Manual for Hypodermic Medication*, page 899, by Dr. ROBERTS BARTHOLOW.)

## MIST. PEPSINÆ CO. c. BISMUTHO (Hewlett's).

COMPOSITION—Pepsine, Liq. Bismuthi, Sol. Opil Puri., Hydrocyanic Acid, P.B., Tinct. Nux Vomica, &c.

Highly recommended in various forms of dyspepsia, having a direct action upon the mucous membrane of the stomach and intestines as a sedative. It can be administered with marked and almost instantaneous effect in the irritative form of dyspepsia, more especially when *pyrosis* is a conspicuous symptom, and pain occurs an hour or more after food. In simple neuralgic gastric pain following eating, occurring in feeble subjects, it is especially indicated, and even in *carcinoma* it has been used with great success in alleviating pain and vomiting.

In the dyspepsia of patients, dependent upon some organic disease, and where there is a decided loss of nerve power, it is of singular service. Thus, for instance, a person after a meal complains of a peculiar gnawing and emptiness, with slight pain at the epigastrium—evident signs of general relaxation and loss of nerve power. Clinical experience has shown that it is of great service as a tonic and stomachic. A portion of its value arises, it may be, from its action upon the spinal motor nerve-centres. Be these things as they may, experience has abundantly demonstrated the value of the compound as a stomachic, antidyseptic, and tonic. In general functional atony and relaxation, and in the various forms of dyspepsia, constipation, or diarrhoea, connected with atony of the visceral muscular coat, the Mist. Pepsinæ Co. c. Bismutho is a very valuable remedy. In the *exhausting purging of Phtisis* accompanied with night sweats and restlessness, Dr. Mathews, of Nantwich, has used it with marked and appreciable effect.

Price 10s. 6d. per lb. Physicians will please write Mist. Pepsinæ Comp. (Hewlett's). Dose—Half to one drachm, diluted.

C. J. HEWLETT & SON, Manufacturing Chemists,  
40 & 41, CHARLOTTE STREET, GREAT EASTERN STREET, LONDON, E.C.

## Allen & Hanburys' Castor Oil.

Tasteless. Pure. Active.

Sold everywhere at 6d., 1/-, 1/9 & 3/-

THE LANCET writes:—"We have given it an extensive trial, and find that it is taken both by children and adults without the slightest difficulty, whilst its aperient effects are unquestionable. It possesses all the advantages that are claimed for it."

ALLEN & HANBURYS' CASTOR OIL is guaranteed to be pure Castor Oil of full medicinal activity, yet absolutely without odour and unpleasant taste. It is therefore free from the only drawback that has hitherto attended the use of perhaps the safest, surest and most generally valuable aperient known. *Supplied also in bulk to the profession, hospitals, &c.*

## DR LAVILLE'S LIQUEUR

Has been prescribed by Continental Physicians with always increasing Success for upwards of 50 Years.

— Perfectly harmless. —

# BRAND & CO.'S MEAT JUICE.

B. & Co. respectfully beg to call the attention of the Medical Profession to this preparation, which they have just introduced after a long series of experiments. It consists of the juice of the finest selected English Meat, in its natural state, with the albumen uncoagulated, together with the other nutritive qualities, ready for immediate assimilation. No chemicals are used in its manufacture.

BRAND & CO., 11, LITTLE STANHOPE ST., MAYFAIR, LONDON, W.

# Fletcher's Hydrobromate Syrups

Iron and Quinine (with or without Strychnia), in chemical combination with Bromine, dissolved in pure Hydrobromic Acid, and forming, with Cane Sugar, a permanent and palatable Syrup.

The special advantage which these Syrups possess over other combinations of Iron and Quinine is that they NEITHER CAUSE HEADACHE NOR INTERFERE WITH DIGESTION.

In cases where even small doses of QUININE produce head symptoms of such severity that the desired benefit of the alkaloid cannot be attained, the Hydrobromates may be freely administered without the slightest disagreeable result.

Patients intolerant of IRON in every other form can readily assimilate the Hydrobromate.

In the treatment of *Anæmia, Chorea, Epilepsy, Hysteria, and Nervous Exhaustion*, Fletcher's Hydrobromates are acquiring a daily-increasing reputation.

DOSE.—The ordinary tonic dose is one fluid drachm. In chronic *Anæmia* and in *Epilepsy*, larger doses may be given at discretion.

"We have tried Fletcher's Syrups of the Hydrobromates in cases of pure *Debility*, and of *Debility* complicated with *Epilepsy*, and have found them very satisfactory indeed."—*The Practitioner*.

"Fletcher's Syrups of the Hydrobromates have been for some years before the profession, and have met with general approval. They are exceedingly pure and delicate preparations, and very convenient for use. From a very frequent experience of their action, extending over four or five years, we are able to affirm that in many cases of *Debility, Cerebral Anæmia, Nervous Exhaustion* resulting from overwork and poor assimilation of food, and similar conditions, the use of these Syrups has been followed by excellent results in a very short time."—*The Hospital*.

"In the convalescence of fevers, and in the many forms of *asthenia* that are so common in large cities, we have found them of much benefit, and in none more so than in the *anæmia* of young girls of sedentary occupation, whose opportunities for out-door exercise are too few. Amongst other cases we have tried their efficacy in the treatment of *alcoholism*, and have found that they give tone to the stomach, promote digestion, and restore the tone of the voluntary muscle tissue, getting rid of the tremor that is so characteristic of alcoholic saturation. FOR CASES IN WHICH QUININE IS ADVISABLE THE PRESCRIBER CAN OBTAIN ALL THE GOOD EFFECTS OF THE ALKALOID WITHOUT ANY OF ITS DISADVANTAGES BY PRESCRIBING FLETCHER'S SYRUPS OF THE HYDROBROMATES."—*Medical Press and Circular*.

Originated and exclusively prepared by:—

Fletcher, Fletcher & Stevenson,

Offices: 21, Mincing Lane, E.C.

# VIN MARIANI

(ERYTHROXYLON COCA.)

More than 2000 physicians have certified to the immense sustaining, recuperative, and nourishing properties of this wine, which is indicated cases of

OVER-EXERTION,  
NEURASTHENIA,  
NERVOUS DEPRESSION  
SLEEPLESSNESS,  
NERVOUS DEBILITY  
CONVALESCENCE,  
VOCAL FATIGUE.

When prescribing it, the Medical Profession are strongly advised to specify "VIN MARIANI" in order to avoid the substitution of imitations often worthless, and consequently disappointing in effect.

Price 1s. per Bottle; or 1/6s. per Dozen. To the Medical Profession any quantity post free, at rate of 1/2s. dozen, from WILCOX & CO., 539, Oxford-street, London. Illustrated Treatise on Coca Free.

# CIGARES ASTHMA - DE JOY CHRONIC BRONCHITIS

One of these Cigarettes gives IMMEDIATE RELIEF in cases of *ASTHMA, CHRONIC BRONCHITIS, HAY FEVER, COUGH, and SHORTNESS OF BREATH*, and their daily use effects a COMPLETE CURE. The contraction of the air tubes, which causes tightness of chest and difficulty of breathing, is at once lessened by inhaling the medicated smoke of the Cigarette; a free expectoration ensues, and the breathing organs resume their natural action. Persons who suffer at night with *COUGHING, PHEGM, and SHORT BREATH* find them invaluable, as they instantly check the spasm, promote sleep, and allow the patient to pass a good night.

These Cigarettes are perfectly harmless, and can be smoked by ladies, children, and the most delicate patients, as they are pleasant to use, and contain no substance capable of deranging the system.

Price 2s. 6d. from WILCOX & CO., 539, Oxford-street, London, and all Chemists. To the Medical Profession, 1s. 10d. post free.

# CRYSTALLIZED DIGITALINE Nativelle.

The Paris Academy of Medicine awarded a prize of 6000 francs to M. Nativelle for the discovery of CRYSTALLIZED Digitaline.

CRYSTALLIZED DIGITALINE (NATIVELE) is a definite substance that can always be relied on and administered with exactitude. After a few doses the pulsations of the heart become slower, more regular, and more energetic.

Prepared in Bottles of 60 granules, each granule containing a 2/10th grain (1-milligramme). A Sample, with Opinions of the Press and Medical Profession, free by post from WILCOX & CO., 539, Oxford-street, London. Sold by all Chemists.

# WILCOX & CO'S DESICCATED EXTRACT OF MALT

A Concentrated, Nutritive, and Digestive Food for INVALIDS and CHILDREN.

This preparation embodies all the beneficial properties of the most carefully prepared semi-fluid extracts, and possesses the additional advantages of greater richness in DIASTASE and the impossibility of fermentation. This Powder may be eaten between bread-and-butter or dissolved in liquid, and, being a natural solvent of farinaceous material, it is strongly recommended as an adjunct to Children's Food, and for ladies whilst nursing.

Prepared only by WILCOX & CO., 539, Oxford-street, London, and put up in large bottles at 2s. 6d. each. Messrs. W. & Co. will be pleased to forward a sample of the above to any of the Medical Profession.

# TAR OF GUYOT

It is with this concentrated liquid, that experiments were made in seven large hospitals of Paris, as well as in Brussels, Vienna, Lisbon, etc., against colds, bronchitis, asthma, catarrh of the bronchial tubes and of the bladder, affections of the skin, herpes, eczema.

The Tar of Guyot, by its composition, partakes of the properties of Vichy Water, being at the same time more tonic. It therefore possesses a remarkable efficacy against the diseases of the stomach.

As is well known, it is Tar from which are extracted the most active antiseptic principles. It is for this reason that the Tar of Guyot constitutes in times of epidemics and during the hot weather, a preservative and hygienic drink which cools and purifies the blood.

« This preparation will soon be, I hope, universally adopted. » (P<sup>r</sup>BAZIN, physician at St-Louis Hospital.)

It is only at rue Jacob, 19, Paris, firm L. Frere, A. Champigny & C<sup>o</sup>, succ<sup>rs</sup>, that is prepared the veritable Tar of Guyot.

WHOLESALE DEPOT IN LONDON : F. NEWBERRY & SONS, 1 ET 3, KING EDWARD'S ST., LONDON E. C. HENRI CHURCHILL, 57-58, EAST STREET, BRIGHTON.

## SLINGER'S NUTRIENT SUPPOSITORIES,

Consisting of nearly pure Peptone and Extractive from the Artificial Digestion of Meat. Five Suppositories contain the Extractive of 20 ounces of Meat, in addition to the Peptone. R. H. BOUCHIER-NICHOLSON, Esq., Hull Infirmary, in a case of Gastrostomy, says:—"The beef suppositories (made by SLINGER & SON, York) were of much benefit, the man saying he felt great comfort from their use. The man was saved the pangs of starvation, from which he was fast sinking, when I

first saw him." Manufactured only by SLINGER & SON, Wholesale Druggists, York. Wholesale Agents: Messrs. NEWBERRY & SON, 1, King Edward-street, Newgate-street, London, E. C.

# "PRICE'S GLYCERINE"

## JAMES'S FEVER POWDER.

Prepared by J. L. KIDDLE, Chemist,  
Late of 81, HUNTER STREET, BRUNSWICK SQUARE, LONDON  
Sold in bottles, containing one ounce, at 4s. 6d.; and packets at  
2s. 9d. each.

Messrs. BARCLAY & SONS, 95, Farringdon-street, London, have been  
appointed SOLE Wholesale Agents from this date.  
January, 1878. J. L. KIDDLE.

## PULVIS JACOBI VER., NEWBERY.

This is the ORIGINAL ARTICLE  
from the recipe in  
DR. JAMES'S OWN HANDWRITING  
in the possession of  
MESSRS. NEWBERY.  
Prices for Dispensing:  
1 oz., 9s.; 1/2 oz., 3s. 4d.  
1, King Edward-st., Newgate-  
street, E.C.; 125 years in St.  
Paul's Churchyard.

# CEREBRINE

(Coca Theine Analgesic Pausodun).

More active and more certain than any analgesic yet introduced.  
Specially indicated as a remedy for NEURALGIC MIGRAINE. It has  
been used in the Paris Hospitals with great success in all forms of  
Neuralgic pain—Cerebral, Facial, Intercos'tal, and Sciatic; also in  
the Cephalalgia of Influenza, Menstrual Colic, &c.

CEREBRINE BROMATED.—Neurosis, obstinate Neuralgia, Cerebral  
Congestion.

CEREBRINE IODISED.—Rheumatic Neuralgia, or wherever Iodine  
treatment is indicated.

EUG. FOURNIER, Pharmacien, 114, Rue de Provence, Paris.  
Agents for Great Britain,

ROBERTS & CO., 76, New Bond Street, London.

Sample Bottles free to Medical Men on receipt of card.

## JOHN CLEAVE & SON, SUPERFINE DEVONSHIRE CREAM CONFECTIONS.

Extract from the COURT CIRCULAR, June 11th, 1892:—

"While endorsing everything said by the leading medical journal we  
can say more, having recently visited Crediton, Devon. Lorna Doone,  
which THE LANCET refers to as said to be made from Clotted Cream, we  
can affirm to be a luxurious Toffee which is made from the choicest  
Devonshire Cream, for we have seen it manufactured and we have seen  
the Devonshire Cream Butter Scotch made. There is no doubt as to the  
positive purity of the ingredients used by this firm. Their many  
specialities—Cream Almond Rock, Chocolate Almond Nougat, Russian  
Toffee, &c., are uniformly delicious. The factory is a model one, and  
is, without exception, the cleanest and sweetest we have ever seen."

Sold by HERBERT & CO., 54, Ludgate-hill, London.

## TO MEDICAL MEN. OFFER OF

FREE

for USE in RICKETS and  
EMACIATION among POOR  
CHILDREN.

EXTRACTED WHEAT PHOSPHATES are the  
SPECIAL NUTRITIOUS FEATURE of  
"FRAME FOOD" DIET.

A LEADING LEEDS PHYSICIAN writes:—

"Ill-nourished and rickety infants and little children have improved  
under the use of the DIET in a manner veritably little short of marvellous."

We shall be glad, on application, to supply "Frame Food"  
Diet free to Medical Men for testing in cases as above.

FRAME FOOD CO., LTD.,  
LOMBARD ROAD, BATTERSEA, LONDON, S.W.

# CLARK'S STARCHLESS BISCUITS.

A most pleasant article of food for those suffering  
from Diabetes, Gout, Dyspepsia, Obesity, and  
other ailments in which a non-starchy  
diet is indicated.

THE LANCET says:—"An analysis of these biscuits shows that they  
contain all the food constituents of flour minus the starch. Our own  
analysis, which approximately agrees with that submitted to our  
notice, gave the following results:

Moisture .. .. .	2.51 per cent.
Mineral matter (especially rich in soluble phosphate) ..	5.58 "
Albuminoids .. .. .	43.47 "
Extractives and soluble matter .. .. .	30.00 "
Fat .. .. .	18.48 "

Microscopic examination confirmed the foregoing analysis; there was  
no starch and no bran. The biscuits are exceedingly palatable, crisp,  
and of excellent texture, and, from the fact that they contain no  
glucose-yielding substances, may well be included as acceptable and  
valuable food-stuffs in the dietary of diabetic patients."

The BRITISH MEDICAL JOURNAL "finds the biscuits to be free  
from starch and fibre. The percentage of mineral matters is somewhat  
high, as would naturally be anticipated, and they contain a large pro-  
portion of phosphates. A very small proportion of reducing sugar  
is present—0.5 per cent. The biscuits are well made, and they possess  
the advantage of being very similar in appearance to an ordinary biscuit."

SAMPLES sent FREE to Members of the MEDICAL PROFESSION.

Half-pound Tins, 1s. 9d.; Pound Tins, 3s. 3d.

SOLD BY ALL LEADING CHEMISTS AND DRUGGISTS; OR MAY BE OBTAINED

## PIMM'S NATIVE OYSTERS FOR INVALIDS.

These celebrated Oysters (*specially selected for Invalids*) can now be obtained in Quarter Barrels, containing 3 doz., price 14s., and can be despatched by Parcel Post at the 10<sup>d</sup>. rate to any part of the United Kingdom. These Oysters are much patronised, and highly recommended by the leading Physicians and Medical Profession throughout the country. Full directions for opening and keeping sent with each barrel. Larger sizes packed. Oyster knives 6d. extra.

PIMM'S, 3, 4, and 5, Poultry, E.C.

# ROBINSON'S CONCENTRATED WATERS

ESTABLISHED 1855.

One Ounce of these waters added to Forty Ounces of Distilled Water forms a clear Medicated Water (without filtering), similar in every respect to those prepared according to the directions of the British Pharmacopœia, and free from all Chemical Impurity. They are prepared to supply a want long felt by Chemists and Medical Men, and by their use a fresh supply of any of the Medicinal Waters may be obtained at a moment's notice. They are not affected by age in any climate. N.B.—Used in the proportion of one part to thirty-two of water, they represent the Medicinal Waters of the *United States Pharmacopœia*.

## SALT & SONS' ORTHONEMIC ABDOMINAL BELT.

REGISTERED No. 198,010.

69, CORPORATION STREET,  
BIRMINGHAM.

Read THE LANCET Opinion, Oct. 22nd, 1892:—

"MESSRS. SALT & SONS of Corporation-street, Birmingham, have submitted to us for examination a new form of abdominal belt which they have designated as above, and the construction of which exhibits exceptional features. Two illustrations of the belt are given, a front and a side view. From these it will be seen that the diagonally arranged front elastic webs (separated by the central whalebone) follow the direction of the external abdominal muscle, and supply the lifting support so desirable in these appliances, transmitting the weight of the abdomen to the upper portion of the hips, whence it is distributed by the horizontal side webs equably towards the back, the lacing being also elastic. The transverse top and bottom webs in the front clip the body and retain the belt in its proper position, thus dispensing with

perineal straps, which cause so much discomfort. The complicated straps and bands added to most belts to assist their fit are avoided, and the appliance is consequently very simple, the arrangement of the elastic fibres causing it to fit perfectly in every way. The belt appears to be well calculated for increased efficiency, and at the same time an acceptable advance towards simplicity of application."

Made in Silk Elastic price 68/- | And in Thread Elastic price 42/-  
POST FREE ON RECEIPT OF CHEQUE OR P.O.O.

Measurements required—Circumference at A, B, C.

LONDON AGENT:

Mrs. KROHNE, 8, Duke Street, Manchester Square.

## THE HAMMOCK LEG REST.

The advantages claimed for this Leg Rest are as follows:—

Firstly and foremost.—The exceeding ease it affords to those who use it, owing to the leg being suspended in the hammock or sling, which can be extended even to the thigh if needed.

Secondly.—It can be used as a bed-leg rest by placing the back of the rest against the end of the bed.

Thirdly.—That the foot or leg can either be kept warm or cool by the use of woollen covering or hammock netting, &c.

Fourthly.—The height can be easily altered, and the leg raised to any height, or lowered to within one inch of the ground; thus it can be used when writing at a table with much comfort and ease.

Fifthly.—It can be got ready for use, or taken from together in about forty seconds; the cover forming a bag or satchel, in which the whole can be placed, and readily packed in portmanteau or trunk or carried in the hand.

## SALMON'S ABDOMINAL BELT.

In Silk Elastic and Thread ditto. From 25s. to 50s.

The Belt is light in texture, and affords a more lifting support than any hitherto made, completely supporting the lower part of the Abdomen. It is recommended in cases of Obesity, Tumour, Prolapsus Uteri, and during and after Pregnancy.

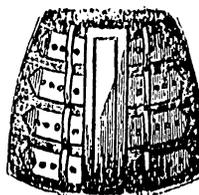

**HENRY R. SALMON,**

42, Beaumont-street, Upper Wimpole-street, London, W.  
(from 87, Wimpole-street).

NOTICE—Mr. SALMON does not associate electrical properties with any of his Surgical Bandages.

## SALMON'S OBSTETRIC BINDER.

For Immediate Use after Delivery. 6s. 6d., by post 6s. 9d.

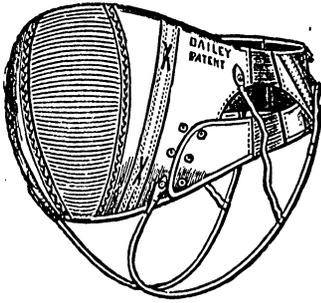

The Binder is a substitute for the towel generally used immediately after labour. It is made of strong linen, and dispenses with the usual pinning. The advantages of the Binder are facility of application, combined with comfort and greater efficiency. Measurement required, ordinary size of waist. Each one stamped with name and address.

## Title Registered. "DOCTOR'S ULSTER."

Made from genuine Irish Frieze, waterproofed without the use of indiarubber, and fitted with special instrument pockets. Thousands of our Winter Wraps have now been supplied to Gentlemen of the Medical Profession, and we have permission to give private reference to Medical Gentlemen in nearly every part of the kingdom.

The New "BALLYLAREEN" DUFFLE FRIEZE is now introduced. An exquisitely thick, warm, and light fabric, more closely resembling the constitution of the natural fleece of wool than anything ever previously produced in a loom. Two measures only are required—Height and Chest Measure. Samples post free from

**BOYD & COMPANY, Belfast.**

## THE EIDERDON RUG.

The QUEEN, Nov. 21st, 1891, says:—  
"AN IDEAL RUG. No other words will express the many excellent qualities which we find combined in the splendid Rug lately introduced by Boyd & Company of Belfast. This new rug, though it is quite of unusual thickness, is extraordinarily light. For warmth as a wrap, either when travelling or spread over an invalid's couch, we hold it unequalled. It is as soft as down, yet practically indestructible. The same fabric is supplied for dressing gowns and for the Ladies' Circular Capes which are fashionable. The Rug is made

From JAMES G. DICKSON,

## The College of State Medicine,

LONDON.

A CLASS under the supervision of A. MACFAYDEN, M.D., B.Sc., and J. GLAISTER, M.D., D.P.H., is being formed for Practical Microscopical Work.

This Class is intended for Medical Officers of Health, Public Analysts, and Students of Hygiene. The main impurities present in or added to Food-Stuffs, Beverages, and Water will be practically studied. Each member of the Class will prepare a typical series of permanent specimens.

The Course will begin on January 4th, 1893.

Full particulars may be had from

W. R. CORNISH, Surg.-General, Honorary Secretary.

101, Great Russell-street, W.C.

### DIPLOMA IN PUBLIC HEALTH.

## King's College, London.

A Special Class will be held under the direction of Professor WILLIAM R. SMITH, M.D., D.Sc., D.P.H. Camb., in preparation for the April Examination of the University of Cambridge, beginning Tuesday, January 3rd, 1893, at 4 P.M.

This Class is intended for gentlemen who registered their medical and surgical qualifications prior to January 1st, 1890. It will embrace all the subjects required for the above examination. Fee, Twelve Guineas.

### LABORATORY INSTRUCTION.

A Six Months' Course of Public Health Instruction including two months in the Bacteriological Laboratory, for gentlemen who obtained their medical qualifications subsequent to January 1st, 1890, will begin on Tuesday, January 3rd, 1893.

The Laboratories will be open daily from 10 A.M. to 4 P.M., except on Saturday, when they close at 1 P.M.

Fee for the complete Course (inclusive of apparatus) 20 guineas.

For Syllabus apply to J. W. CUNNINGHAM, Esq., King's College, London.

## Oral Education of the Deaf.—Mr.

H. N. DIXON, M.A. Lond. and Cambridge, F.L.S., gives a thorough and high-class education to Deaf Children, based upon the Oral Method.

The School has lately been removed to larger and more convenient premises—Apply, Wickham House, East Park, Northampton

## Urgent Appeal.—In consequence of

prolonged and most serious illness, an old University College man and family are reduced to greatest distress and in need of immediate aid. An appeal is made in their behalf to the more fortunate members of our profession.

Particulars may be obtained of:—

Dr. TURLE, Woodside-grange, Finchley, N.

Dr. JOY, Northwold, Norfolk.

Dr. FRISTON, 924, Old Kent-road, S.E.

Mrs. EVERETT, St. Cuthbert's, Lansdown, Bath.

Mrs. and Miss JOINSTONE, Sloane-street, Brighton.

Miss DOBBING, 32, Compton-avenue, Brighton.

Who will also thankfully receive even the smallest donations sent.

## Royal London Ophthalmic Hospital,

Moorfields, E.C.

Courses of Instruction on the following subjects will be given at the Hospital, commencing on Jan. 9th, 1893:—

The Use of the Ophthalmoscope; on Tuesdays and Thursdays. By Messrs. Gunn, Silcock and Lawford.

Errors of Refraction; on Mondays. By Mr. Lang.

External Diseases of the Eye; on Fridays. By Mr. Morton.

Fees for the Ophthalmoscope Class, 2 guineas.

Refraction, 1 guinea.

External Diseases, 1 guinea.

Perpetual Students of the Hospital are admitted free.

Further particulars may be had of the Secretary.

ROBERT J. NEWSTEAD, Secretary.

## Medical Curriculum at Cooke's

SCHOOL.—The School having been recognised by the London University and the Society of Apothecaries, a department for Curriculum Work has been formed in which instruction is given meeting the requirements of the two first years of medical studies. Special advantages are offered in regard to practical work in Anatomy and Physiology, on the lines of the "Dissection Guides" in respect of the former subject. Through the School being open during the Summer the course of studies preparatory to Parts I. and II. of the Primary Examination of the Society of Apothecaries—that is, up to and including Anatomy and Physiology, and initiatory to clinical work—can be taken out in twelve calendar months, starting from any date. It is intended, in regard to the Curriculum, to take on only a small number of earnest workers, the object being to instruct men who, on their becoming efficient in practical work, will be able, if so inclined, to act as prosectors and physiological assistants to the School, and thus to take part in the "Supplementary Teaching," which is the main feature of the Institution. —Particulars on application to Mr. THOMAS COOKE, F.R.C.S., 40, Brunswick-square, W.C.—THE BLAND SUTTON ENTRANCE PRESENTATION, conferring the privilege of free education in all the subjects of the First and Second Years of the Medical Curriculum, is given in October of each year.

## The College of State Medicine,

LONDON.

### DEPARTMENT OF PUBLIC HEALTH.

Professor: A. WYNTER BLYTH, M.R.C.S., Barrister-at-Law &c.

# LONDON LIFE ASSOCIATION,

81, KING WILLIAM STREET, E.C.

Established 1806.]

Funds in Hand ... £4,150,000.

PREMIUM FOR EACH £100 ASSURANCE.		
AGE NEXT BIRTHDAY.	MOIETY PAYABLE DURING FIRST SEVEN YEARS.†	ESTIMATED PREMIUM IN EIGHTH YEAR.
25	£ s. d. 1 6 9	£ s. d. 1 0 11
35	1 13 6	1 6 1
45	2 4 11	1 15 0
55	3 4 9	2 10 6
65	4 14 5	3 13 8

The Association's **HALF PREMIUM** System provides a maximum of assurance at a minimum of cost.

†A half (if amounting to £10) of a member's ordinary premium during the first seven years may remain as a loan on the policy, interest (4 per cent. only is now charged) being yearly paid. It is anticipated that the eighth year's premium will be reduced by not less than 61 per cent. (with the prospect of further *gradual* reduction), and the loan may then be repaid by instalments or continued at pleasure.

**THE COPPICE, NOTTINGHAM. HOSPITAL FOR MENTAL DISEASES.**

President: The Right Hon. the Earl MANVERS.

This Institution is for the reception of a limited number of Private Patients of Both Sexes, of the Upper and Middle Classes only, at moderate rates of payment. It is pleasantly situated on an eminence a short distance from Nottingham, and commands an extensive view of the surrounding country; and from its singularly healthy position affords every facility for the relief and cure of those mentally afflicted.

Particulars as to terms &c. may be obtained from Dr. TATE, the Medical Superintendent.

**Private Home for the Treatment of INSANE LADIES.**

**ASHBROOK HALL, HOLLINGTON,**  
 within half an hour's walk of St. Leonards-on-Sea, conducted by the Widow of the late Samuel Hitch, M.D., formerly of Sandywell-park, near Cheltenham, for many years Physician to the General Lunatic Asylum for the County of Gloucester.  
 Station: Warrior-square, St. Leonards. Telegraph Office: Silverhill.  
 For particulars and terms, apply to Mrs. LETITIA A. HITCH.

**Church Stretton Private Asylum,**

**STRETTON HOUSE, Church Stretton, Salop.** Established 1859. (For Gentlemen only.) 600 ft. above sea level. Bracing air, farm, extensive grounds, and every facility for occupation and amusement; 4 1/2 hours from London. Terms moderate. Suites of rooms for first-class cases.  
 Superintendent, CAMBELL HYSLOP; Medical Superintendent, Dr. HORATIO BARNETT, B.A., M.B. Cantab., M.R.C.S., &c.  
 (See Medical Directory for further information.)

**Grove House, All Stretton, Church STRETTON, SHROPSHIRE.**

A Private Home for the Care and Treatment of a limited number of LADIES mentally afflicted. Climate healthy and bracing.  
 Apply to Mrs. MCLINTOCK (widow of the late Dr. McLintock), the Resident Proprietress, or to the Medical Superintendent.

**Barnwood House Hospital for MENTAL DISEASES, Barnwood, near Gloucester.**

Exclusively for Private Patients of the Upper and Middle Classes. This Institution is devoted to the Care and Treatment of persons of both sexes at moderate rates of payment. The terms vary according to the requirements of the patients, who can have private rooms and special attendants, or be accommodated in Detached Villas and in the Branch Convalescent Establishment on the hills. Under special circumstances the rates of payment may be greatly reduced by the Committee.—For further information, apply to J. G. Soutar, M.B., the Med. Supt.

**Harpenden Hall, Herts.—For the**

Treatment and Cure of LADIES mentally afflicted. Patients are under the immediate care of the proprietor and his wife. Carriage exercise and every amusement provided. Twenty-five miles from London. Midland station quarter of a mile.—Apply to A. MACLEAN, Proprietor and Medical Superintendent.

**Warneford Asylum, Oxford.—This**

Asylum, for the care and treatment of the Insane of both sexes of the middle and upper classes, is pleasantly situated on Headington-hill, near Oxford, and has been recently enlarged. The grounds are extensive, and cricket, tennis, billiards, dances, and other amusements are amply provided. There are now vacancies for patients at moderate charges.—For particulars, apply to the Medical Superintendent, Dr. BTWATER WARD.

**Wye House Asylum, Buxton, Derby-**

shire, for the Middle and Upper Classes of BOTH SEXES, is beautifully situated in the healthy and bracing climate of the Derbyshire hills, and is directly accessible by the Midland and the London and North-Western Railways.—For terms and other particulars, address the Resident Physician and Proprietor Dr. F. K. DICKSON

for the Treatment and Cure of Ladies of the Upper and Higher Middle Classes suffering from the above. Highly successful results. Private sitting-rooms if required. Cons. Phys.: Dr. B. W. RICHARDSON, London. Medical Attendant: Dr. J. ST. T. CLARKE, Leicester.—For terms &c., apply, Mrs. THEOBALD, Tower House Leicester.

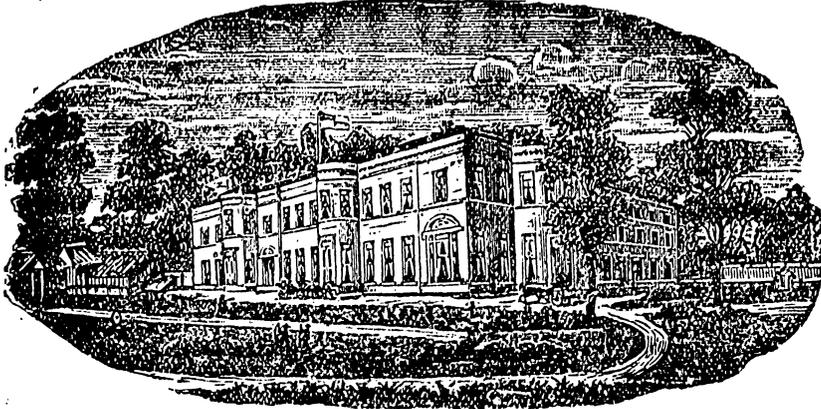

**MAVISBANK HOUSE, NEAR EDINBURGH.**

A Hospital for the Insane and a Home for Mental and Nervous Invalids.  
 Chairman of the Board of Direction—The Right Honourable Sir Thomas Clark, Bart., Lord Provost of the City of Edinburgh.  
 Mavisbank House is about six miles from Edinburgh, in the beautiful neighbourhood of Roslin. It is a comfortably furnished old mansion, containing large and handsome dining- and drawing-rooms, billiard-room, library, conservatory, and private parlours.  
 The estate is upwards of 120 acres in extent, with stabling, large flower and fruit gardens, hothouses and vinerias.  
 The Directors have arranged to receive a limited number of patients at ONE GUINEA A WEEK, who will reside in the comfortable farmhouse on the estate. They will receive careful supervision and every comfort.  
 The terms are inclusive, clothing only excepted.  
 Mavisbank House is five minutes' walk from Polton Station, on the North British Railway.  
 For further information, apply to the Resident Medical Superintendent, Mavisbank House, Polton, Midlothian

**WONFORD HOUSE HOSPITAL FOR THE INSANE, near EXETER.**

A REGISTERED HOSPITAL FOR THE UPPER AND MIDDLE CLASSES.  
 This Institution is situated in a beautiful and healthy locality, within a short distance of the City of Exeter.  
 There is comfortable accommodation at moderate rates, both in the Hospital itself and at Plantation House, Dawlish, a seaside residence on the South Devon Coast, affording more privacy, with the benefits of sea air and a mild and salubrious climate.  
 Private Rooms and Special Attendants provided, if required.  
 Voluntary Patients or Boarders also received without certificate.  
 For terms &c. apply to  
 F MAURY DEAS, M.B., M.S. Lond.,  
 Resident Medical Superintendent

**HAYDOCK LODGE, NEWTON-LE-WILLOWS, LANCASHIRE,**

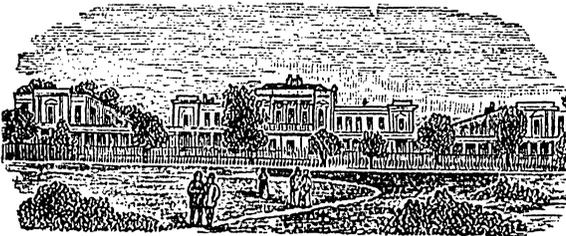

Is charmingly situated in a healthy and retired neighbourhood, midway between Liverpool and Manchester, about two miles from Newton-le-Willows Station on the London and North-Western Railway. It is a comfortably furnished country mansion, especially adapted for the care and treatment of persons of unsound mind. Besides the use of the general sitting-rooms &c., patients of both sexes can have private apartments and special attendants at moderate rates of payment.

Information as to terms &c. may be obtained on application to the Resident Medical Superintendent—

**CHARLES T. STREET,**

# BUXTON, DERBYSHIRE.

On the Mountain Limestone, 1000 ft. above Sea Level.

## THE WARM MINERAL-WATER BATHS OF BUXTON.

*Natural Temperature of Water, 82° Fahr.*

**AVERAGE NUMBER OF BATHERS DURING PAST 20 YEARS, 62,867 PER ANNUM.**

These very extensive Baths are fitted with all modern appliances for Bathing with either the natural or heated Mineral Water, and also for the Massage Treatment.

The warm Springs of Buxton have been resorted to from the earliest ages for the cure of Rheumatic and Gouty Affections.

On application at the Duke of Devonshire's Estate Office, Buxton, lists of charges for Bathing, with Analysis of the Water and all necessary information, will be forwarded.

Medical Gentlemen will, on personal application at the same Office, receive an order to view and make use of the Baths free of all charge.

### Private Asylum.—Ashwood House, Kingswinford, Staffordshire.—

For the reception and Medical treatment of a limited number of Ladies and Gentlemen, nervously or mentally afflicted. The House stands in picturesque grounds of 40 acres in extent; the soil, sand and gravel; climate genial; the locality notoriously healthy. The patients associate with the family, congenial occupation is encouraged, and every possible freedom allowed consistent with safety. Carriage exercise, billiard table, tennis lawns, and a variety of amusements provided. Boarders received without certificates. Friends of patients, if desirous, may reside in the house *pro tem*.—Proprietors, Drs. PEACOCK and PETERSEN; late Bodington and Peacock, co-Licenseses.

### MENTAL AND NERVOUS DISORDERS, West Malling Place, Kent.

Beautifully situated in a retired position in one of the healthiest localities in England. An easy distance from town on the Sevenoaks and Maidstone Railway. Old established, fully equipped, and perfectly adapted in itself, and by its surroundings, for CARE AND CURE UNDER HOME-LIKE CONDITIONS. Resident Physician and Proprietor, Dr. JAMES ADAM, late Physician-Superintendent, Crichton Royal Institution, &c. (26, Harley-street, Cavendish-square, W., Wednesday mornings). Voluntary Boarders received under the new Act without Certificates.

ESTABLISHED 1862.

### INTEMPERANCE AND NARCOTICS.

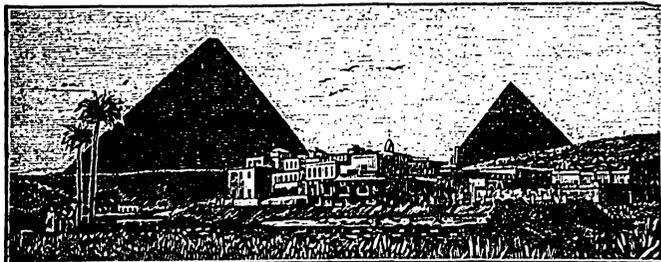

## KINGSWOOD PARK, near Bristol.

R. W. BRIMACOMBE, L.R.C.P.Lond., M.R.C.S.Eng.,  
*Resident Medical Adviser.*

A Private HOME for the Treatment and Cure of Gentlemen wishing to overcome the Propensity. Healthy and cheerful situation, near Clifton and Bath. Patients can be sent for or received on receipt of telegram. Dr. OWEN PRITCHARD, Consulting Physician

Telegraphic address—"Brimacombe, Kingswood, Bristol."

### Winter Health Resort—MENA HOUSE, Pyramids, NINE MILES FROM Cairo.

This first-class family hotel is built and arranged like an English country house with every luxury and home comfort. It has beautiful and very large drawing-room, library, and billiard-room, with two full-sized English tables, a splendid mosque dining-hall with a raised gallery round for private parties, and table d'hôte in the central hall. Comfortable bed- and sitting-rooms, furnished with English furniture. The whole house is lighted with electric light. There is a marble swimming-bath attached to the hotel for the use of guests. The hotel has very extensive stables, and a great number of Arab riding horses and donkeys with English saddles. Well-appointed Victorias, dog-carts, and other carriages can be had at a moment's notice. Besides these private conveyances the "Mena" coach runs daily between Cairo and the hotel with a team of English horses. A char-a-banc with an Arab team runs daily from Mena to Cairo and back, thus facilitating visits to the town. Adjoining the hotel is an English church. Both the English chaplain and physician, Arthur J. M. Bentley, M.D., reside in the house. A competent English head nurse will superintend all arrangements connected with invalids, for whom every delicacy can be had. The hotel has its private racecourse with stand, where during the season Gymkhanas are held. There are also lawn-tennis courts and a golf ground, and good sport can be obtained in the neighbourhood. An ice machine on the premises ensures a constant supply of ice. Drinking water from an Artesian well. A herd of cows is kept for the supply of pure milk. For those who are desirous or are compelled to winter in Egypt this hotel, situated at the foot of the Pyramids, and surrounded by the dry, invigorating air of the Desert, offers unusual attractions, and is well worthy of the attention of the Medical Profession. Season commences about December 10th. For particulars apply to MANAGER, Mena House Hotel, Cairo, Egypt.

### Resident Patients. — Margate. —

M.D. Lond., F.R.C.S. (married), residing in a commodious house facing the sea, in best position, with tennis lawn in front, has accommodation for one or two of the above. Drainage guaranteed perfect. Terms moderate, according to requirements. — Address, Dr. Crook, Dalby-square, Margate.

### Invalid can be received in house of

Medical Man at Brighton, close to sea and downs. Trained Nurse kept. Massage and electricity. Sea water laid on. Epileptic or paralysed case can be received. Terms from £2 2s. a week.—Apply to Dr. Pendleton, 10, The Drive, Brighton; or E. Gotton-Salmond, 71, Chesapside, E.C.

Massage, Baths, and Electrical treatment carried out under medical supervision.—Apply to Dr. CECIL A. P. OSBURN (late of Church Streeton), Resident Physician.

**St. Luke's Hospital, London, E.C.—**

Established 1751.

This Hospital was established for the Treatment of Mental Diseases of the Upper-middle and Middle Classes, for whom there is no statutory relief. Preference is given to acute cases, and these are admitted either gratuitously or on payment of a weekly sum varying from 14s. to 30s., according to the circumstances of each; and chronic cases can only be admitted at the higher rates. Patients are eligible for admission from any part of the United Kingdom.

Forms of application may be had from, and inquiries addressed to, the Secretary, at the Hospital.

PERCY DE BATHUR, M.A. Secretary

**Earlswood, near Redhill. — This**

Institution is situated in the most healthy, pleasant, and picturesque part of Surrey. The extensive estate comprises over 200 acres of finely wooded grounds, and is well laid out in paths and drives.

The Institution, being a home and school, is especially adapted for the development, training, and education of backward children, there being a skilled staff of governesses, teachers, and nurses.

Roomy, extensive, and well-ventilated workshops are also provided, where instruction is given in every branch of industry, serving as occupation or amusement for the pupils.

Accommodation is also provided for harmless and quiet ladies and gentlemen by means of private rooms fitted up with every comfort, special attendance, carriages, &c. Terms, according to accommodation, from £1 5s. per week, inclusive of all extras. Medical Superintendent, Robert Jones, M.D. LOND.—For further information, apply to the Secretary, Mr. JAMES DOWNING, 86, King William-street, London Bridge, E.C.

Every candidate for the office of House Surgeon must be a Fellow or Member of the Royal College of Surgeons of England and a Licentiate of the Society of Apothecaries, or of the Royal College of Physicians, or a Graduate of Medicine of any University recognised by the Medical Council. He will receive an honorarium of £50 per annum and will be provided with board and lodging in the Hospital. Applications, with testimonials &c., must be sent in on or before Saturday, January 14th, 1893, to the Secretary of the Hospital.

By order,  
Commander BLOUNT, R.N., Secretary.

**The Victoria Hospital for Sick**

CHILDREN, Queen's-road, Chelsea, S.W.—The Managing Committee are prepared to receive applications for the Office of HOUSE PHYSICIAN to the In-patients of this Hospital, which will become vacant on February 15th, 1893. Every candidate for the office of House Physician must be a Fellow or Member of the Royal College of Surgeons of England and a Licentiate of the Society of Apothecaries, or of the Royal College of Physicians, or a Graduate of Medicine of any University recognised by the Medical Council. He will receive an honorarium of £50 per annum and will be provided with board and lodging in the Hospital. Applications, with testimonials &c., must be sent in on or before Saturday, January 14th, 1893, to the Secretary of the Hospital.

By order,  
Commander BLOUNT, R.N., Secretary.

**A Vacancy in the office of Visiting**

APOTHECARY to ST. GEORGE'S HOSPITAL, having occurred by the resignation of Mr. T. H. Smith, Candidates for this office, who must be registered under the Medical Act of 1858, should make application in writing to the Secretary of the Hospital on or before the 18th January.

The appointment will be made by a Committee of Governors elected for that purpose. Candidates canvassing directly or indirectly any member of the Committee will be deemed ineligible for election.

Candidates are invited to attend at the Hospital on the day of the meeting of the Committee, which they will learn on application to the Secretary.

By order,

CHARLES J. TODD, Secretary.  
St. George's Hospital, Weekly Board, Dec. 28th, 1892.

**Appointment of Medical Superin-**

TENDENT.—The METROPOLITAN ASYLUMS BOARD require the services of a Medical Superintendent at the DARENTLI SCHOOLS for INBECILES, near Dartford, Kent. Salary £460 per annum, with furnished residence, coals, gas, milk, garden produce and washing.

The Schools, with the attached pavilions, contain accommodation for 1050 patients and the necessary staff of officers and servants.

The appointment will be on probation for three months and will be subject to the approval of the Local Government Board.

Candidates must not exceed forty-five years of age and must be duly registered and qualified to practice both Medicine and Surgery in England.

Preference will be given to those candidates who have had experience in institutions for the insane.

Forms of application, with particulars of the duties, can be obtained at the Offices of the Board, Norfolk House, Norfolk-street, Strand, W.C., where such forms, duly filled up and accompanied by copies of not less than three recent testimonials, must be delivered not later than 4 o'clock P.M. on Monday, January 23rd, 1893.

Personal canvassing is strictly prohibited and will disqualify any candidate.

Selected candidates will be written to.

By order,

T. DUNCOMB MANN, Clerk to the Board.  
Chief Offices, Norfolk House, Norfolk-street, Strand, W.C.,  
December 24th, 1892

\***MIDLANDS.**—An old-established PRACTICE, situated in a village  
ten miles from a large town. It is worth about £650 per annum,  
including Clubs and other appointments over £300. Capable of  
considerable increase. Large modern residence, with stabling,  
garden &c. attached. Hunting, fishing and shooting.

£300 A YEAR.—In a County Town in the West of England, possessing ex-  
ceptional educational advantages, a well-established PRACTICE  
of at least £800 per annum (some years exceeding this), including  
appointments. Present incumbent, who is retiring, has held the  
Practice ten years. Excellent family residence with large garden  
(well stocked). Coachhouse and stabling attached. Rent £00 a  
year. Premium £1000, part down and balance on the termination  
of an equal partnership introduction.

\***PARTNERSHIP.—PARTIAL OCCUPATION.**—An active Gentleman  
required as Partner in a CASH PRACTICE, yielding £200 last  
year. He would be required to attend to the duties of the prac-  
tice on three days a week only, but it is a sine qua non that he  
should reside on the premises, which are situate within a mile of  
Charing-cross. Half-share for disposal. Premium £550.

**PRIVATE PRACTICE WITHOUT MIDWIFERY.**—Cash receipts  
about £900 per annum. In hands of present incumbent nearly  
twenty years. The Practice is not a Dispensary, but a fair amount  
of ready cash is taken in small fees. Expenses light. The house  
is pleasantly situated in an open north-eastern suburb of London.  
Premium £1000.

£1000 To £1200.—The leading PRACTICE in a small manufacturing  
Town in the North Midlands offers for negotiation. Appointments  
yield £130. Only forty to fifty cases of Midwifery, and very little  
night work. Good house, with stabling, garden &c. attached;  
rent moderate. An efficient introduction.

\***IN A PARTICULARLY ATTRACTIVE TOWN,** about twenty miles  
from London, an old-established good-class PRACTICE, the  
actual cash receipts of which have averaged £500 to £550 per  
annum for the past three years. Very little Midwifery; fees  
1 to 5 guineas. Appointments (not Union) yield £100. There  
are many wealthy seats in the neighbourhood. Good society.  
Educational advantages and excellent train service. Modern  
residence available. Premium one and a half year's purchase.

**SOUTH.**—£1000 a year.—In a favourite watering-place an inexpensively  
worked PRACTICE of £1000 a year, including appointments of  
£200 to £300. Only one horse required. Pleasant residence  
(facing the sea), with garden, coachhouse and stabling; rent  
moderate. A six months' partnership introduction given.  
Premium two years' purchase.

\***WESTERN COUNTY.**—In an exceptionally beautiful district, an old-  
established COUNTRY PRACTICE, worth about £500 a year.  
Nearest medical man resides five miles distant. The fees are  
good: 10s. 6d., 7s. 6d., 5s., and in a few rare cases 3s. 6d. No  
Midwifery under 1½ guinea. Only twenty cases yearly. Good hunt-  
ing and fishing. Premium one year's purchase. An efficient in-  
troduction.

**IN A PLEASANT SEAPORT TOWN** in the South of England an  
increasing PRACTICE of £900 per annum is for disposal. As a  
considerable portion of the income is received in ready money, the  
successor would not require any reserve capital, as the invest-  
ment would yield an immediate return. The expenses are con-  
fined to the house rent (which is very moderate) and drug bill.

Apply to J. C. NEEDES, 1, Adam-street, Adelphi, W.C.

### Locum Tenens and Temporary

ASSISTANTS.—Practitioners requiring the above can im-  
mediately obtain thoroughly reliable qualified Gentlemen upon application  
to 1, Adam-street, Adelphi, W.C. Every Gentleman engaged by the  
Office in either of the above capacities is personally known to Mr.  
J. C. Needes. An office fee of half a guinea is payable by the principal.

Telegraphic Address: "Acquirement—London."

# THE SCHOLASTIC, CLERICAL AND MEDICAL ASSOCIATION, LIMITED.

## MEDICAL DEPARTMENT.

This Association was established in 1890 as a Limited Liability Company under the direction of professional men, its object being the creation of a RESPONSIBLE and THOROUGHLY TRUSTWORTHY Agency. The Medical Department has met with so great success that it has been found necessary for one of the Managing Directors (Mr. G. B. Stocker) to devote his whole attention thereto; and he has the assistance of an experienced Medical Accountant and a large staff of clerks. Further, a Board composed entirely of gentlemen of high standing in the Medical Profession has been appointed, and to them matters of dispute and complaint are referred.

The Association undertakes the SALE of PRACTICES and PARTNERSHIPS; the INTRODUCTION of LOCUM TENENS and ASSISTANTS; MEDICAL ACCOUNTANCY (by a duly qualified Medical Accountant); INVESTIGATION and VALUATION of Practices, &c.; POSTING BOOKS and sending out Bills, &c. &c.

A Pamphlet relating to the Medical Department, with the names of the "Directors" and "The Medical Advising Board," and terms, will be sent on application to—MR. G. B. STOCKER, MANAGING DIRECTOR, 8, LANCASTER PLACE, STRAND, W.C.  
Telegraphic Address—"Triform, London."

ASSISTANTS and LOCUM TENENS SUPPLIED.

ADDRESS—Mr. G. B. STOCKER, Managing Director, Medical &c. Association, Limited, 8, Lancaster-place, Strand, W.C.

**MEDICAL DIVISION.****THE  
INCORPORATED AGENCIES  
(LIMITED).**

This Agency is established under the patronage of eminent Members of the Medical Profession for the purposes (*inter alia*) of—

1. Negotiating the Sale or Exchange of Practices, Medical, Hydropathic and other Establishments.
2. Providing Assistants, Locum Tenens, Partners, Tutors, Pupils &c., investigating their competency and character previous to engagement.
3. The Investigation and Auditing of Accounts and Posting same, Recovering and Purchasing Debts and other Assets, Raising Loans and Securing eligible Investments, Settling Disputes by Arbitration and Providing Agents and Trustees.
4. The Procurement of Resident Patients and Medical Appointments.
5. Insuring and Underwriting Life Policies, Managing the Estates and Practices of deceased Practitioners in town or country and Providing Legal Assistance and Advice in all emergencies.

Full particulars of Practices and all information to be had of the General Manager, Mr. H. T. CLEMENTS, at the Offices, 215, Piccadilly, Piccadilly Circus, London

(Established 1878).

**Mr. Percival Turner**

(Son of a well-known Practitioner),  
Telegraphic Address— 4, Adam-street, Adelphi, London, W.C.  
"EPSOMIAN, LONDON." (close to THE LANCET Office).

**Practitioners seeking Partners or**

Successors can be immediately introduced to suitable candidates by Mr. Turner, he having always very many more purchasers than vendors on his books, thereby enabling him to carry out the arrangements, if desired, without the delay and publicity of advertising. PURCHASERS supplied with details of Practices for Disposal free of charge on application.

LOCUM TENENS or ASSISTANTS free of expense to Principal. Only those known to be reliable introduced.

BOOKKEEPING, DEBT-COLLECTING, ARBITRATIONS, INVESTIGATIONS OF PRACTICES for Purchasers, &c.

\*\* USUAL LIST NEXT WEEK.

**MEDICAL TRANSFER OFFICES**

19, Craven-street, Strand, W.C.

Established 1868.

**Mr. W. T. Peacock, Medical Transfer**

and PARTNERSHIP AGENT, informs the Profession that he has special facilities for introducing Successors and arranging Partnerships; that if Members who are desirous of Disposing of their Practices will forward him full particulars (and which will be received in strict confidence) an immediate Transfer will probably be effected.

Gentlemen requiring Practices or Partnerships can, on application, select and obtain full particulars of those on Mr. Peacock's books which are open for negotiation.

ASSISTANTS and LOCUM TENENS, with satisfactory testimonials as to sobriety and general abilities, can be engaged at very short notice. No charge made to purchasers or for inquiries.

Office hours from 10 to 5; Saturdays, 10 to 2.

**MEDICAL BOOKKEEPING AND ACCOUNTS.****Mr. W. T. Peacock makes this a**

special branch of his business, and continues to undertake the posting and balancing of Books annually or otherwise by thoroughly efficient Clerks at his own Office, or, if preferred, at the Residence of Medical Gentlemen (in Town or Country), and, when desired, will make and send out the accounts.

NOTE.—Outstanding accounts in Town or Country also promptly collected.

Prospectus of Terms &c., which are strictly moderate, will be sent post free, or can be obtained on application at Mr. Peacock's Offices, 19, Craven-street, Strand, W.C.

**MEDICAL TRANSFER AND PARTNERSHIP.**

82, Ludgate-hill.

**Messrs. Orridge and Co., Medical**

Transfer Agents, Referees, and Valuers, in offering their services to the Profession, have pleasure in referring to the fact that for ABOUT HALF A CENTURY the name of Mr. ORRIDGE has been known in the advertising columns of the leading medical journals, and that a very large proportion of the Medical Men throughout the Kingdom have confided their interests in the adjustment of PARTNERSHIPS and TRANSFERS to their care.

Purchasers who will communicate (confidentially) the NATURE and EXTENT of their wishes regarding investment can be apprised of appropriate opportunities as they occur.

On occasions where ADVICE is required in forming a correct conclusion as to the worth or eligibility of a Practice, Messrs. ORRIDGE & Co. trust that their familiarity with the various contingencies that govern value will be found of considerable service to those by whom they are employed. N.B.—No charge is made to purchasers.

**MEDICAL ACCOUNTANCY.**

In connexion with the S. C. and Medical Association, Limited.

INVESTIGATION OF PRACTICES.

ARBITRATIONS.

DEBTS COLLECTED.

BOOKS POSTED AND AUDITED.

PARTNERSHIP ACCOUNTS ADJUSTED.

Mr. MORRIS, F.S.A.A., 8, Lancaster-place, W.C.

**MEDICAL TRANSFER AGENCY (ESTD. 1860).****Mr. Herbert Needes (son of the late**

Mrs. Needes, and for the past twelve years associated with her in the management of this old Agency) is still carrying on the Business, and will be glad to negotiate the Transfer of PRACTICES and PARTNERSHIPS on the usual terms. No connexion with any other Office.

LOCUM TENENS.—Reliable Gentlemen always on the Books. ASSISTANTS provided free of charge to Principals.

\*\* THE USUAL LIST WILL APPEAR NEXT WEEK.

168, EUSTON-ROAD, N. W.

**Cavendish-square District.—Unfurnished PROFESSIONAL RESIDENCES and CONSULTING ROOMS** available in the following positions at distinctly moderate rents and prices:—Harley, Wimpole, Queen Anne, Welbeck, Mansfield and other leading streets; Cavendish square and place.

Messrs. White, Druce & Brown are in many cases the sole agents, and will be happy to supply every information concerning the above on application at their offices, 9, Brook-street, Hanover-square, W.

**Elliott, Son, & Boyton, 6, Vere-**

street, Cavendish-square, are the best local AGENTS for Houses and Consulting-rooms in Harley, Wimpole, Welbeck, Queen Anne, and other leading streets of Cavendish and Portman Squares. Lists on application. Their old-established connexion affords them special knowledge and much exclusive information concerning properties in the neighbourhood.

**Professional Chambers (Savile-row,**

W.).—Three ROOMS (en suite) on ground floor, furnished, suitable for a Medical Man. Page in attendance.—Enquire of Sidney Chapman, Solicitor, 10, Pancras-lane, E.C.

**To Let, two Suites of Rooms in**

Marlbro' Mansions, which have been occupied by medical men for several years. The ground floor suite is well fitted up as a Surgery, containing bottles, drugs, furniture &c., which can be taken at a valuation. This is a first-class opportunity for any Medical Gentleman wishing to commence Practice, as formerly a good cash Practice was carried on. The rents for both suites are very moderate.

Apply to Mr. Glynn, Letting Office, Marlbro'-mansions, Victoria-street, from two till four.

**Southport.—To Let in this favourite**

watering-place very superior RESIDENCE now occupied by medical man, and particularly adapted for resident patient. Splendid opportunity. Part furniture must be taken, about £200.—Address, S., THE LANCET Office, 428, Strand, W.C.

**Wanted, by Practitioner with £3000**

to invest, a good PRACTICE or PARTNERSHIP, returning not less than £300 a year. Applicant is experienced, married, and ready to purchase immediately. Good house necessary, and residential district with some society.—Address, Oak, THE LANCET Office, 428, Strand, W.C.

**Wanted, a good class Country Town**

PRACTICE or PARTNERSHIP. Income £600 upwards. Kent, Surrey, or Sussex preferred. No agents.—Address, Picton, 4, The Manor Way, Blackheath-park, Blackheath, S.E.

**M.S., M.B., offers a premium of £25**

for a good foreign opening for PRACTICE, or a proportionate sum commensurate with definite prospects.—Victor, THE LANCET Office, 428, Strand, W.C.

**Wanted to Purchase, a Family**

PRACTICE in London, Suburbs, or neighbourhood, from £800 to £1200, by Graduate, twelve years standing. No agents need apply.—Address, F. 510, Messrs. Deacons, Leadenhall-street, E.C.

**Partner wanted, in a good increasing**

Practice in a residential district near London. Present returns about £700 a year, with unusual scope for increase. Half-share for Disposal now and Succession in a year or two. Illness sole cause of retirement. Moderate premium.—Apply to Mr. Percival Turner, 4, Adam-street, Adelphi, London, W.C.

**For Sale, Partnership. A Third or**

Fourth Share in a large and good country town Practice in North-East Lancashire. Purchaser must be well qualified, experienced and active. Principals only dealt with.—Apply to S. Crossley, Solicitor, 1, Richmond-terrace, Blackburn.

**Practice in Rothesay, Scotland, for**

Sale.—The first-class Practice (valued at about £1200 a year) of the deceased Dr. Hunter is for immediate Sale.—For further particulars apply to John T. Wilson, Town Clerk, Rothesay.

**£700 a year.—For Disposal, an old-**

established, unopposed PRACTICE, held over twenty years, and entirely transferable, including £150 from appointments; on usual terms. Good house and garden &c. On line of rail within three hours of London. A very good and safe investment for any Gentleman seeking Country Practice in good agricultural district.—Address, Absolute, THE LANCET Office, 423, Strand, W.C.

**West-end.—For immediate Dis-**

posal, near Cavendish-square, a Cash PRACTICE. Fees from 1s. 6d. Midwifery £1 1s. Established some years and worked by assistants. Three good rooms, well fitted with sleeping accommodation. Other rooms can be had. An unusual opportunity for a gentleman wishing to practise as a specialist at the West-end. Incumbent anxious to secure a death vacancy in the south. Premium, to include furniture, fittings, and drugs, £130 down. Every investigation allowed.—Address, Vendor, THE LANCET Office, 423, Strand, W.C.

**Nucleus of Cash Practice in an East-**

end suburb for immediate disposal. Good opening for a steady energetic man with small capital. For particulars &c. apply to Esse x care of Pearse, solicitor, 9, Zingari-terrace, Gipsy-jane, Forest Gate, E.

**£700 a year.—In the best part of a**

large Northern Town, a good increasing PRACTICE, mostly prescribing and worked without horse or assistant, will be sold for £1000. Good house and large garden. Partnership introduction given and every investigation invited. Fees mostly 6s. to 10s.—Address, Anglican, THE LANCET Office, 423, Strand, W.C.

**Dispensary and Private Practice for**

SALE in Eastern Suburb. Average of the last four years' receipts over £950 per annum. Price £800. Good introduction given.—Address, M. N., THE LANCET Office, 423, Strand, W.C.

**North Wales.—A Country Practice**

for Disposal, returning from £750 to £800 a year. All good-class patients. Vendor has received a county appointment. All particulars from Dr. W. Williams, Dolgelly.

**Medical Practice in Australia for**

Disposal. Cash receipts about £1400. Price £600. Glasgow references. Good fees.—Full details from James Logan, Scottish Medical Agency, 95, Bath-street, Glasgow.

**Assistantship wanted by a Fourth-**

year's Student of a London Hospital, with several years' experience in Club, Union, and high-class Private Practice, to Visit, attend Midwifery and Dispense. Aged thirty-six. Can ride and drive.—Address, Medicus, Hixon Vicarage, Stafford.

**An experienced Medical Man, aged**

forty, will be free at the beginning of February to take Charge of a Practice in the absence of principal, or would act as Temporary Assistant with a view to purchase either a share or the whole.—Address, T. B., THE LANCET Office, 423, Strand, W.C.

**Qualified in Surgery and Midwifery**

(Conjoint).—Wanted an ASSISTANCY, in or near London; two years' experience of Private Practice; able to ride and drive. Time required for reading and two or three afternoons off a week for hospital. References. Small salary required.—Evans, Wotherton Hall, Chirbury, Salop.

**Assistants and Locum Tenens sup-**

plied on the shortest notice. Apply to G. B. Stocker, Esq., Secretary, Medical &c. Assn., Ltd., 3, Lancaster-place, Strand, W.C. The rule of the Association is that no Assistant shall be recommended till direct inquiries have been made as to his antecedents. Names of the Committee of Management and descriptive pamphlet on application.—Telegraphic address, "Triform, London."

**Advertiser, age 28, having had**

experience in General Practice, and able to visit, dispense, and attend ordinary Midwifery, desires RE-ENGAGEMENT with a Medical Man to assist in every way possible. Salary is not so much an object as a comfortable home.—Address, in first instance, to C. E. L., THE LANCET Office, 423, Strand, W.C.

**Assistantship wanted, by a married**

unqualified Gentleman of strictly steady and refined habits. Well up in all branches of Practice, including Midwifery. He is of good appearance and possesses tact in his work. Ride and drive. As he is a very neat and accurate Dispenser and Bookkeeper is open to a post as such only. Testimonials.—Medicus, 23, Market-square, Dover.

**A Student of St. Mary's Hospital,**

aged twenty, reading for Intermediate M.B. (Lond.), is anxious to reside with a Doctor, for whom he would Dispense in partial return for board and residence.—Apply, Whitehead, 101, London-road, Leicester.

**Out-door Assistantship wanted by**

a married Man. Experienced in all kinds of General Practice. Good Accoucheur, and well received by patients. Full curriculum. Ride and drive, light weight. Good references.—Apply G., 51, Victoria-street, Bridport, Dorset.

**Dispenser, married (no family), re-**

quired at once. Must be neat, accurate and quick. Wife as caretaker.—State salary required and particulars, by letter, to Dr. Jolly, Lorrimore-square, S.E.

**Assistancy wanted, unqualified.**

Well up in all branches of the profession. Disengaged.—Alpha, THE LANCET Office, 423, Strand, W.C.

**An experienced Assistant seeks an**

Engagement. Portions of Final only to pass. In- or out-door. Good appearance and address and thoroughly reliable.—W. P., THE LANCET Office, 423, Strand, W.C.

**Assistancy (unqualified) wanted, by**

a Gentleman; experienced; age thirty-seven; single. Is a good Dispenser and Bookkeeper. Can Visit and attend Midwifery. Moderate salary. Excellent reference.—Address, Ilex, 63, Aston-road North, Birmingham.

**A doubly qualified and registered**

Gentleman desires Employment for part time. Well acquainted with Parish, Club, Dispensing and General Practice. Gentlemanly and obliging, sober and reliable. Has a good knowledge of electro-therapeutics.—Address, with few particulars, to G. T. B., 129, Finborough-road, S.W.

**Assistantship wanted by M.B., B.Ch.,**

out-door, and London or large Provincial Town preferred. Age twenty-seven; experienced, practical and reliable; good Accoucheur; well received. Unmarried. Excellent references. Would manage branch. Disengaged.—Apply, stating particulars, to Medicus, High Bank House, Openshaw, Manchester.

**L.R.C.P., M.R.C.S. Eng., recently**

qualified (Guy's), aged twenty-five, desires ASSISTANCY.—Address, Wm. Barry G., 2, Grove Crescent-road, Stratford, E.

**Dispenser.—Third-year Student,**

passed Intermediate (M.B.), wishes to Assist a Doctor in the evening. Dispense or Book keep. Salary, or board and lodging in lieu of same. Easy reach of Hospital. Highest references—J. Robkitson, University College, Gowor-street.

**£40 thanks to anyone who will pro-**

vide an Appointment for a doubly qualified Man. Prison, asylum, or public institution preferred, but not essential. Age twenty-eight. Protestant. Abstainer. Experienced.—Eccs, THE LANCET Office, 423, Strand, W.C.

**A trebly qualified Practitioner,**

middle-aged and of good address, who lately sold his Country Practice, would be glad of Employment in London or suburbs. Sole Charge of Branch (not Dispensary), attendance at consulting-rooms, or would assist in good middle or upper-class Practice.—Apply, Physician, THE LANCET Office, 423, Strand, W.C.

**A Gentleman requires an Assistancy.**

He is unqualified, single, aged thirty. Experienced; first-class references.—Address, stating terms, Scalpel, THE LANCET Office, 423, Strand, W.C.

**A Gentleman (doubly qualified,**

1883) requires an ASSISTANTSHIP in a Country Practice. Well received by patients of all classes. Experienced in Private, Club and Union Practice. Ride and drive. Permanency preferred. Aged thirty-three.—Please address, stating terms, to M.R.C.S., 2, Grosvenor-place, Weymouth.

**Wanted, a qualified, unmarried, out-door, Welsh-speaking, Visiting ASSISTANT, in a Colliery and Ironworks district. Salary £150 a year.—Apply, with reference, Dr. Redwood, Rhydney, via Cardiff.**

**Wanted, a qualified in-door ASSISTANT, to Dispense, attend Midwifery, and take night work. The post is suitable for a reading man, and to such an one facilities would be given for seeing hospital practice.—Address, stating age, qualifications, experience, and salary required, to Dr. Sinclair White, Brook Hill, Sheffield.**

**Wanted, qualified Assistant, to take independent Charge of Branch Surgery. £150 a year and commission guaranteed, with also furnished rooms, attendance, coal and gas. Personal interview indispensable. No testimonials or photos to be sent.—Apply, before ten any morning, to Dr. Bourke, 40, Redcliffe-square, Earl's Court Station.**

**Wanted, qualified Assistant (out-door), to Visit, Dispense &c. Preference given to an English University Graduate with whom, if suitable, a permanent arrangement might be made. Not much Midwifery. Situation, North Midlands.—Address, with full particulars, Scapula, THE LANCET Office, 423, Strand, W.C.**

**Wanted, a qualified out-door ASSISTANT, to help in Visiting and Dispensing.—Apply, with full particulars and reference to last principal, Alpha, 74, Durning-road, Liverpool.**

**Wanted, by M.B., B.Ch., registered and B.A., twenty-five years of age next March, an ASSISTANT-SHIP, with view to Partnership, in a Country Practice, South of England or Midlands preferred. Ride and drive well; light weight; medium height; total abstainer; fifteen months' experience of country Practice. Interview could be arranged.—Address, Rural, THE LANCET Office, 423, Strand, W.C.**

**Wanted, Assistantship in good-class Practice by M.D., registered, aged twenty-seven. Has held hospital and University appointments and has acted as Locum Tenens in town and in country. Abstainer. High recommendations. Time for reading and but little night work preferred.—Address, Theta, THE LANCET Office, 423, Strand, W.C.**

**Wanted, an Assistantship, by an unqualified man (thirty-seven). Can Visit, Dispense, keep Books, and attend ordinary Midwifery. The very best references one could wish.—Address, A. Y., 48, St. George's-road, Southwark, S.E.**

**Wanted, unqualified Assistantship, by L.M. Coombe Hospital. Nearly all curriculum. Total abstainer; single; can ride and drive; has been two years in practice. Good references from former principals.—J. C. K., 1, Belmont-terrace, Donnybrook, Dublin.**

**Wanted, an Assistantship or Management of a Branch, with view to Partnership, by a University Graduate in Medicine and Surgery. Age thirty; considerable experience both as locum tenens and hospital.—Apply, Dunelin, THE LANCET Office, 423, Strand, W.C.**

**Wanted, an in-door Assistantship by doubly qualified gentleman, aged thirty, single. Experienced. Tall. Steady and energetic. Ride and drive.—Medicus, Port View, Shildon, near Teignmouth.**

**Wanted, an Assistantship with view to Partnership, by doubly qualified (Edin.) Man, age thirty-two, single, popular, experienced. (Good references.—Address, M. D. D., THE LANCET Office, 423, Strand, W.C.**

**Wanted, unqualified Assistancy, in-door. Full curriculum and extras. All Exams. but Final. Unmarried, twenty-eight. Couptent for Dispensing, Visiting, and Clubs. Ride and drive. State salary.—S., Laurels, South Shore, Blackpool.**

**Wanted, by M.B. and C.M., an ASSISTANCY, in- or out-door. Aged thirty-two. Experienced. Excellent testimonials. Unmarried. Desires permanency. Please state salary and particulars.—Apply to H. B. M., THE LANCET Office, 423, Strand, W.C.**

**Complete Outfit for Electrolysis, by Law of New York, including thirty cells, in perfect working order. Cost originally £40. Price £20.—Apply to Mr. Lawson Tait, 7, The Crescent, Birmingham.**

## CULLETON'S HERALDIC OFFICE,

25, Cranbourn-st., St. Martin's-lane, London, W.O.

(Established Half a Century):

For SEARCHES and HERALDIC INFORMATION.

The HERALDIC & GENEALOGICAL LIBRARY contains over a Thousand Volumes of English and Foreign printed Works and MSS., being Indexes of Armorial Bearings and References to Family Descents. Also Indexes and References to Pedigrees and Arms in many of the Public Archives.

PEDIGREES TRACED, Genealogical Searches made, and existing Pedigrees Corrected. Pedigrees drawn up in Tabulated Form from Family Papers, and Engrossed on Parchment.

SEARCHES MADE FOR ARMS, CRESTS, AND MOTTOES. ARMORIAL BEARINGS EXAMINED AND VERIFIED.

ARMS OF HUSBAND AND WIFE BLENDED.

LIVERY INFORMATION: Colours for Servants' Liveries; what Buttons to be used according to Heraldic rules.

SKETCHES and PAINTINGS of ARMS by FIRST-CLASS ARTISTS.

HATCHMENTS CORRECTLY PAINTED. Arms Painted on Silk

Banners for Sheriffs, also for all other Official purposes.

F.B.—Armorial Bearings incorrectly depicted being rectified upon the bearer.

ILLUMINATED ADDRESSES on Vellum Engrossed and Painted in most Artistic Styles. Designs for Official Seals for Boroughs, Corporations, Public Companies, &c.

Livery Button-dies, engraved with crest, 42s. the pair. Livery Buttons, plated or gilt. Harness Crests.

BRASS DOOR PLATES supplied ready for fixing. A Brass Plate engraved with name only, on mahogany block, complete, 10s. 6d.; with name and profession, 17s. 6d. MEMORIAL BRASSES. Stencil Plates.

Culleton's Guinea Box of Stationery contains half ream of BEST QUALITY paper and SQUARE ENVELOPES, all stamped in COLOUR with Crest, Monogram, or address. No charge for engraving steel die.

Seal Engraving.—Crests and Monograms engraved on Seals, Rings; and on Steel Dies for stamping notepaper. A neat Desk Seal, engraved with crest, 15s. 6d.

Gold Seals, from £1 1s. to £6 6s. A large collection of genuine old Gold Seals.

Signet Rings, all 18-carat. Large variety to select from—£2 2s. to £10 10s. Send size of finger by fitting piece of wire. Rings made to order at same prices.

General Engraving.—Names and inscriptions engraved on presentation cups, medals, watches, Ivory, &c. Crests engraved on spoons and family plate, 6s. per dozen.

Book Plates (ex libris) in ancient and modern styles.

Visiting Cards.—Fifty, best quality, 2s. 8d., Ladies' 5s., including the engraving of copper plate. Wedding cards; all the latest styles. Memorial cards. Return thanks, Invitations.

Culleton's Embossing Press, for Stamping prescriptions and notepaper with arms, crest, monogram, or address, 10s. 6d. Die extra.

T. CULLETON, Heraldic Stationer and Engraver, 25, Cranbourn-street, St. Martin's-lane, London, W.C. Five minutes from Piccadilly and Charing-cross. (P.O. orders payable at New-street, W.C.)

## THE LONDON SANITARY PROTECTION ASSOCIATION.

The Association has no Share Capital, and cannot be used for purpose of profit.

The Members of Council give their services gratuitously.

PRESIDENT: THE DUKE OF ARGYLL, P.C., K.T., K.G.

THE OBJECTS OF THE ASSOCIATION ARE:—

To provide its members, at moderate cost, with such advice and supervision as shall ensure the proper sanitary condition of their own dwellings, to further and assist sound sanitation, and promote the interests of sanitary science.

Apply to the Secretary,

21, GREAT GEORGE STREET, WESTMINSTER, S.W.

## EMBALMING.—To Practitioners.

If you are required for Embalming apply to Dr. BAYLE, Specialist (to the Profession only), with his patented GOLDEN FLUID, Bromide of Gold and Acetophenone, and his patent apparatus of compressed air.

Success guaranteed, without mutilation, without unclenching or moving the body out of the bed, without any effusion of blood or the slightest alteration in figure, or even in the lineaments of the face, the operation taking less than one hour to perform. For further information, particulars as to fee, appointments, references, &c., apply,

51, TAVISTOCK SQUARE, W.C.

**PHYSIOLOGISTS!****This is the Science of Foods  
in a Nutshell.**

For the due support of a human being there are required—(1) water, (2) minerals, (3) nitrogenous foods, (4) non-nitrogenous foods, and, of course, (5) oxygen, or the food we obtain from the air. Now, excluding air, water, and minerals, it is evident the public should be made aware that **both** nitrogenous and non-nitrogenous foods are required for the body's support, and this for the plain reason that **both** these classes of substances are found making up part and parcel of the human frame.

**The Nitrogenous Foods** are represented by albumen (white of egg and beef juice); casein (found in milk); gluten (found in flour), and to a less typical extent by gelatin. These foods build up the tissues of the body; less directly, they may serve as energy-producers.

**The Non-Nitrogenous Foods** are starches and sugars, and fats and oils. They are the great "working" foods of the body, and give us "energy," which is "the power of doing work."

This is the science of foods in a nutshell. Coming now to the vital question of the supply of the **Nitrogenous Foods**, always a moot point in economics as in physiology and medicine, we find Meat Juice—that is, the uncooked albumen of beef—to stand foremost as a food of this class. **It resembles the most vital of our tissues in chemical composition; therefore it can be converted into our body's material with the least possible expenditure of digestive power.** Note this first fact as a crucial point in the whole theory and practice of feeding children, invalids, and even those in robust health.

On the market of late years have been placed Beef Essences and Extracts innumerable. Of most of these Extracts it may be said that they are merely **stimulants, not food.** Dr. G. Yeo, in his recent works on "Foods" (p. 208), speaks of a widely advertised Beef Extract: "It does not, however, represent a true nutritive albuminate, as it contains no albumen or fibrin." He adds it is "not capable of acting as a substitute for meat." Again, speaking of Meat Extracts, Dr. Yeo says: "A great number of condensed fluid meat extracts are prepared, most of which are of value as nutritious restoratives, but none of them can be said to be capable of completely taking the place of meats."

Why, then, should the public waste their money on such Extracts which are not "foods" at all in the true sense of the term? and why should invalids be fed on that which, however it may stimulate, will not build up and strengthen the weakened frame? Echo answers "Why?"

Science, however, comes to our rescue here. There has been prepared a true Nitrogenous Food in the shape of **Caffyn's Liquor Carnis**, which is **actually the uncooked juice of meat** (or muscle-plasma) preserved by the addition of a non-nitrogenous food, thus giving to the world, for the first time, a perfect nitrogenous food for body-building in combination with another food as a preservative substance.

— **Caffyn's Liquor Carnis** may be administered with reasonable expectation of admirable results in the following ailments:—

(1) **Anæmia** (or bloodlessness and "want of tone"). In this complaint the Liquor Carnis, as a nitrogenous food, supplies the blood with albumens and proteids in a readily digestible form, and thus combats one of the chief causes or conditions of the disease.

(2) **Dyspepsia and Painful Digestion.** Here the importance of a food which will be peptonised or "stomach-digested" at once is evident; Caffyn's Liquor Carnis represents such a food.

(3) **In Tubercular Ailments** (of which phthisis or consumption is a manifestation) the necessity for maintaining strength is obvious. The administration of cod oil and other forms of fat is indicated in tubercular disease, but associated with such remedies the highest authorities agree that a fair supply of nitrogenous food is required for the nutrition of the body; Caffyn's Liquor Carnis supplies such a food in perfect proportions.

(4) **In the Feeding of the Infant** Caffyn's Liquor Carnis can represent the albuminoid constituents which are naturally present in milk; and in the process of tissue formation such a food may give to hand-fed children an immense advantage in respect of its supplying them with the requisite materials for the growth of the most vital parts of their frames.

(5) **In the Feeding of the Aged** Caffyn's Liquor Carnis is of immense value. In the "second childhood," as in the first, food has to be given on the "little and often" principle. Hence its concentrated form makes it the ideal food for old persons.

(6) **In the diet-treatment of Fevers**, where it is of the utmost importance to administer fluid nutriment susceptible of ready incorporation with the blood, Liquor Carnis is being used with the happiest results by physicians. These are a few of the more prominent applications of Caffyn's Liquor Carnis to the normal nutrition of young and old, and to the wants of those who are invalided from any ordinary cause.

The problem of infant and invalid feeding has thus been solved. There is no need to complain that now stimulating Beef Extracts form the only means of giving to those of weak digestion their quantum of nitrogenous matter. **Caffyn's Liquor Carnis stands as the ideal food of the physiologist.** Science declares it to be so, and from this court of arbitration and investigation there is, and there can be, **no appeal.**

**The LIQUOR CARNIS CO., Ltd. 50, Holborn Viaduct, London, E.C.**

PRINTED and PUBLISHED by the REGISTERED PROPRIETORS at No. 423, Strand, and Nos. 1 and 2, Bedford-street, Strand, in the Parish of St. Martin-in-the-Fields, Westminster, in the County of London, and sold by all Booksellers and Newsvendors in Great Britain and Ireland and the Colonies.—Saturday, December 31st, 1892.
